- A master device is defined as a device operating in a mode in which it has the capability to transmit without receiving an
 enabling signal. In this mode it is able to select a channel and initiate a network by sending enabling signals to other devices
- A client device is defined as a device operating in a mode in which the transmissions of the device are under control of the
 master. A device in client mode is not able to initiate a network.

(4) Statement of Conformity for the Client in Non-Associated mode

The client software and associated drivers will not initiate any transmission on DFS frequencies without initiation by a master. This includes restriction on transmissions for beacons and support for ad-hoc peer-to- peer modes.

| ☐ Apply | ☑ Does not apply |
|---------|------------------|
|---------|------------------|

(If apply, pls help to provide explanation on it was implement, and how software was controlled)

Sincerely,
