1 INTRODUCTION

1.1 COMPLIANCE STATEMENT

This report has been prepared on behalf of SOLOSHOT, Inc. to support the attached Application for Equipment Authorization. The test report and application are submitted for an Intentional Radiator under Part 15.247 (10/2014) of the FCC Rules and Regulations and Spectrum Management and Telecommunications Policy and under RSS-247 issue 2 of Innovation, Science and Economic Development Canada (ISED). This Certification Test Report documents the test configuration and test results for the SOLOSHOT, Inc. SOLOSHOT3 **Base with Bluetooth Operation**.

Testing was performed on an Open Area Test Site (OATS) of Washington Laboratories, Ltd, 7560 Lindbergh Drive, Gaithersburg, MD 20879. Site description and site attenuation data have been placed on file with the FCC's Sampling and Measurements Branch at the FCC laboratory in Columbia, MD. The ISED OATS numbers are 3035A-1 and 3035A-2 for Washington Laboratories, Ltd. Site 1 and Site 2, respectively. Washington Laboratories, Ltd. has been accepted by the FCC and approved by ANAB under Certificate AT-1448 as an independent FCC test laboratory.

The SOLOSHOT, Inc. SOLOSHOT3 Base with Bluetooth operation complies with the limits for a Digital Transmission System (DTS) Transmitter and Frequency Hopping Spread Spectrum (FHSS) device under FCC Part 15.247 and Innovation, Science and Economic Development Canada (ISED) RSS-247.

2 EQUIPMENT UNDER TEST

2.1 EUT IDENTIFICATION & DESCRIPTION

The SOLOSHOT, Inc. SOLOSHOT3 Base with Bluetooth operation is used in conjunction with a transmit beacon **Tag** (FCC ID: 2ALGWRJSS3T, ISED ID: 22498-RJSS3T). The SOLOSHOT3 Base is fitted with a HD camera that is controlled and streams HDMI to the screen on the unit as well as to an internal mini-SD card. The SOLOSHOT3 Base tracks the position of the Tag, which provides an 802.15 modulated signal that is received by the SOLOSHOT3 base. The SOLOSHOT3 Base continuously tracks the position of the Tag and allows the camera to follow a moving subject.

The Bluetooth and WiFi radios share the same antenna, however, **they do not operate simultaneously.**

Table 1: Device Summary Bluetooth Operation

Item	SOLOSHOT3 Base used with Soloshot Camera
Manufacturer:	SOLOSHOT, Inc.
FCC ID:	2ALGWRJSS3B
ISED ID:	22498-RJSS3B
Model:	SOLOSHOT3 Base with Bluetooth operation
Serial Number of Unit Tested	N/A
FCC Rule Parts:	§15.247
Innovation, Science and Economic Development Canada:	RSS-247
Frequency Range:	2402-2480MHz
Maximum Output Power:	8.9 dBm (7.7mW) at 2442 MHz
Modulation:	Bluetooth
Occupied Bandwidth:	1.96 MHz
Keying:	Automatic
Type of Information:	Data
Number of Channels:	78
Power Output Level	Fixed
Antenna Connector	Internal, not accessible to user
Antenna Type & Maximum Gain	Whip 3.15 dBi
Manufacturer & Model	Molex GPS/WiFi (2.4/5GHz) Combo Balance Flex Antenna 1461860100
Maximum Data Rate	25 Mbps
Power Source & Voltage:	Internal battery charged with USB charger

2.2 TEST CONFIGURATION

The SOLOSHOT3 Base with Bluetooth operation was configured with a detachable camera and set to transmit using the Qualcomm Radio Test Communications (QRTC) software, which allowed the selection of different modulations, frequencies and modes of operation.

2.3 TESTING ALGORITHM

The SOLOSHOT3 Base with Bluetooth operation was tested by configuring the various channels for measurement of the RF parameters.

Once connected to the SOLOSHOT3 Base, commands were sent over the USB connection from a PC. The following modes were tested:

1. BT Hopping and Non-Hopping (carrier and modulated with PS data stream). Power was also measured at the lowest, middle and high channel.

2.4 TEST LOCATION

All measurements herein were performed at Washington Laboratories, Ltd. test center in Gaithersburg, MD. Site description and site attenuation data have been placed on file with the FCC's Sampling and Measurements Branch at the FCC laboratory in Columbia, MD. The ISED Canada OATS numbers are 3035A-1 and 3035A-2 for Washington Laboratories, Ltd. Site 1 and Site 2, respectively. Washington Laboratories, Ltd. has been accepted by the FCC and approved by ANAB under Certificate AT-1448 as an independent FCC test laboratory.

2.5 MEASUREMENTS

2.5.1 References

ANSI C63.2-2016 Specifications for Electromagnetic Noise and Field Strength Instrumentation in the Frequency Range 9 kHz to 40 GHz

ANSI C63.10-2013 American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices

ANSI C63.4-2014 American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz

2.6 MEASUREMENT UNCERTAINTY

All results reported herein relate only to the equipment tested. The basis for uncertainty calculation uses ANSI/NCSL Z540-2-1997 (R2002) with a type B evaluation of the standard uncertainty. Elements contributing to the standard uncertainty are combined using the method described in Equation 1 to arrive at the total standard uncertainty. The standard uncertainty is multiplied by the coverage factor to determine the expanded uncertainty which is generally accepted for use in commercial, industrial, and regulatory applications and when health and safety are concerned (see Equation 2). A coverage factor was selected to yield a 95% confidence in the uncertainty estimation.

Equation 1: Standard Uncertainty

$$u_c = \pm\sqrt{\frac{a^2}{div_a{}^2} + \frac{b^2}{div_b{}^2} + \frac{c^2}{div_c{}^2} + ...}$$

Where u_c = standard uncertainty

a, b, c,.. = individual uncertainty elements

$Div_{a, b, c}$ = the individual uncertainty element divisor based on the probability distribution

Divisor = 1.732 for rectangular distribution

Divisor = 2 for normal distribution

Divisor = 1.414 for trapezoid distribution

Equation 2: Expanded Uncertainty

$$U = ku_c$$

Where U = expanded uncertainty

k = coverage factor

k ≤ 2 for 95% coverage (ANSI/NCSL Z540-2 Annex G)

u_c = standard uncertainty

The measurement uncertainty complies with the maximum allowed uncertainty from CISPR 16-4-2. Measurement uncertainty is not used to adjust the measurements to determine compliance. The expanded uncertainty values for the various scopes in the WLL accreditation are provided in Table 2 below.

Table 2: Expanded Uncertainty List

Scope	Standard(s)	Expanded Uncertainty
Conducted Emissions	CISPR11, CISPR22, CISPR14, FCC Part 15	±2.63 dB
Radiated Emissions	CISPR11, CISPR22, CISPR14, FCC Part 15	±4.55 dB

4 Test Results

4.1 Conducted Emissions

4.1.1 AC Conducted Emissions

Test Arrangement: Table-top/tripod mount

Compliance Standard: FCC Part 15 (10/2014), Class B

FCC Compliance Limits		
Frequency	Quasi-peak	Average
0.15-0.5MHz	66 to 56dBµV	56 to 46dBµV
0.5 to 5MHz	56dBµV	46dBµV
0.5-30MHz	60dBµV	50dBµV

4.1.2 Test Procedure Summary

The requirements of FCC Part 15B and ICES-003 call for the EUT to be placed on an 80 cm high 1 X 1.5 m non-conductive table above a ground plane. Power to the EUT was provided through a Solar Corporation 50 Ω/50 uH Line Impedance Stabilization Network bonded to a 3 X 2 meter ground plane. The LISN has its AC input supplied from a filtered AC power source. Power was supplied to the peripherals through a second LISN. The peripherals were placed on the table in accordance with ANSI C63.4-2014. Power and data cables were moved about to obtain maximum emissions.

The 50 Ω output of the LISN was connected to the input of the spectrum analyzer and the emissions in the frequency range of 150 kHz to 30 MHz were measured. The detector function was set to quasi-peak, peak, or average as appropriate, and the resolution bandwidth during testing was at least 9 kHz, with all post-detector filtering no less than 10 times the resolution bandwidth. For average measurements the post-detector filter was set to 10 Hz.

At frequencies where quasi-peak or peak measurements comply with the average limit, no average measurements need be performed.

4.1.3 Measurement Method

All emission measurements herein were performed according to the referenced standard. Calibration checks are made periodically to verify proper performance of the measuring instrumentation.

4.1.4 Conducted Data Reduction and Reporting

To convert the raw spectrum analyzer conducted data into a form that can be compared with the limits, it is necessary to account for various calibration factors that are supplied with the LISNs and other measurement accessories. These factors are included into the LISN correction factor (LISN corr.) column of the table and in the cable factor (Cable Loss) column of the table. The LISN correction (in dB) and the Cable Loss (in dB) is algebraically added to the raw Spectrum Analyzer Voltage in dBµV to obtain the Conducted RF Electric Voltage in dBµV. This level is then compared to the limit.

Example:

Spectrum Analyzer Voltage:	VdBµV
LISN Correction Factor:	LISN Correction dB
Cable Correction Factor:	Cable Loss dB
RF Electric Voltage Level:	EdBuV = V dBµV + LISN Correction dB + Cable Loss dB

4.1.5 Results Summary

The system complied with the emission requirements throughout the test.

Testing was performed by powering the unit on and set the transmitter to enabled.

Test Date(s): March 13, 2017

Test Engineer/Technician: Mike Violette

4.1.6 Areas of Concern

None

4.1.7 Test Data

Table 5 provides the test results for phase and neutral line power line conducted emissions. Charging power the unit is provided by the Base.

4.2 Conducted Emissions at Antenna Terminals

The general procedure for measuring the conducted energy at the antenna terminals of the device consisted of connecting the output of the EUT to the input of a spectrum analyzer via attenuator pads and bandpass filters, as appropriate for the measurement.

4.3 Bluetooth Hopping Channels

Per §2.1046 and 5.1(d) of RSS 247 require a minimum of 15 hopping channels and a minimum channel spacing of 25 kHz or the 20dB bandwidth of the hopping channel, whichever is greater. The following figure shows that more than 15 channels are employed in the device (78 total channels). In addition, the average time of occupancy shall not be greater than 0.4seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

Figure 1: Hopping Channel Separation

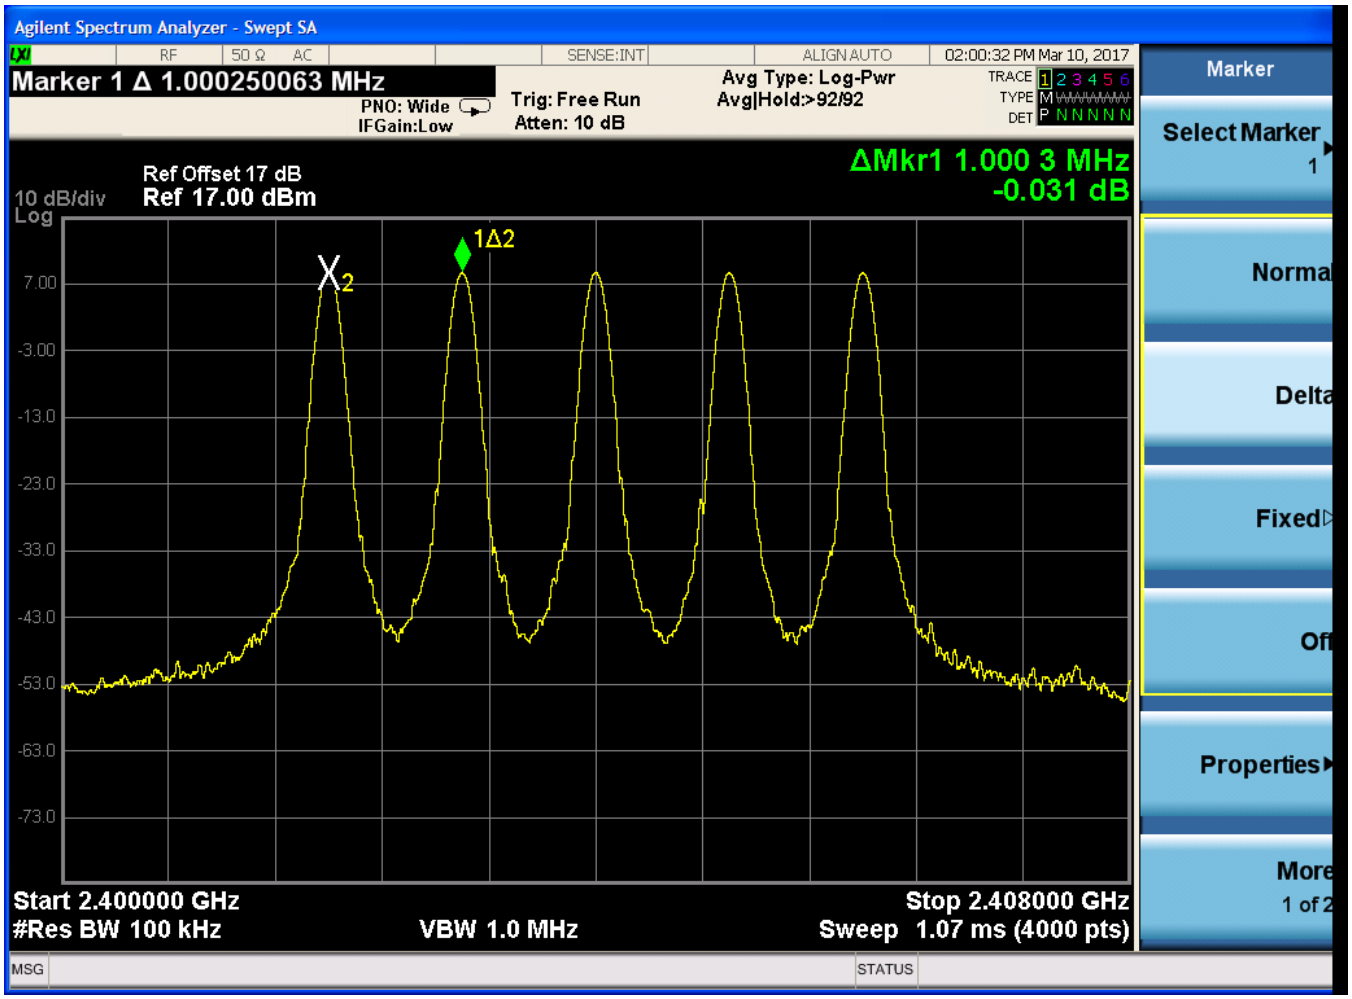

Figure 2: Hopping Channels BT Mode = 78

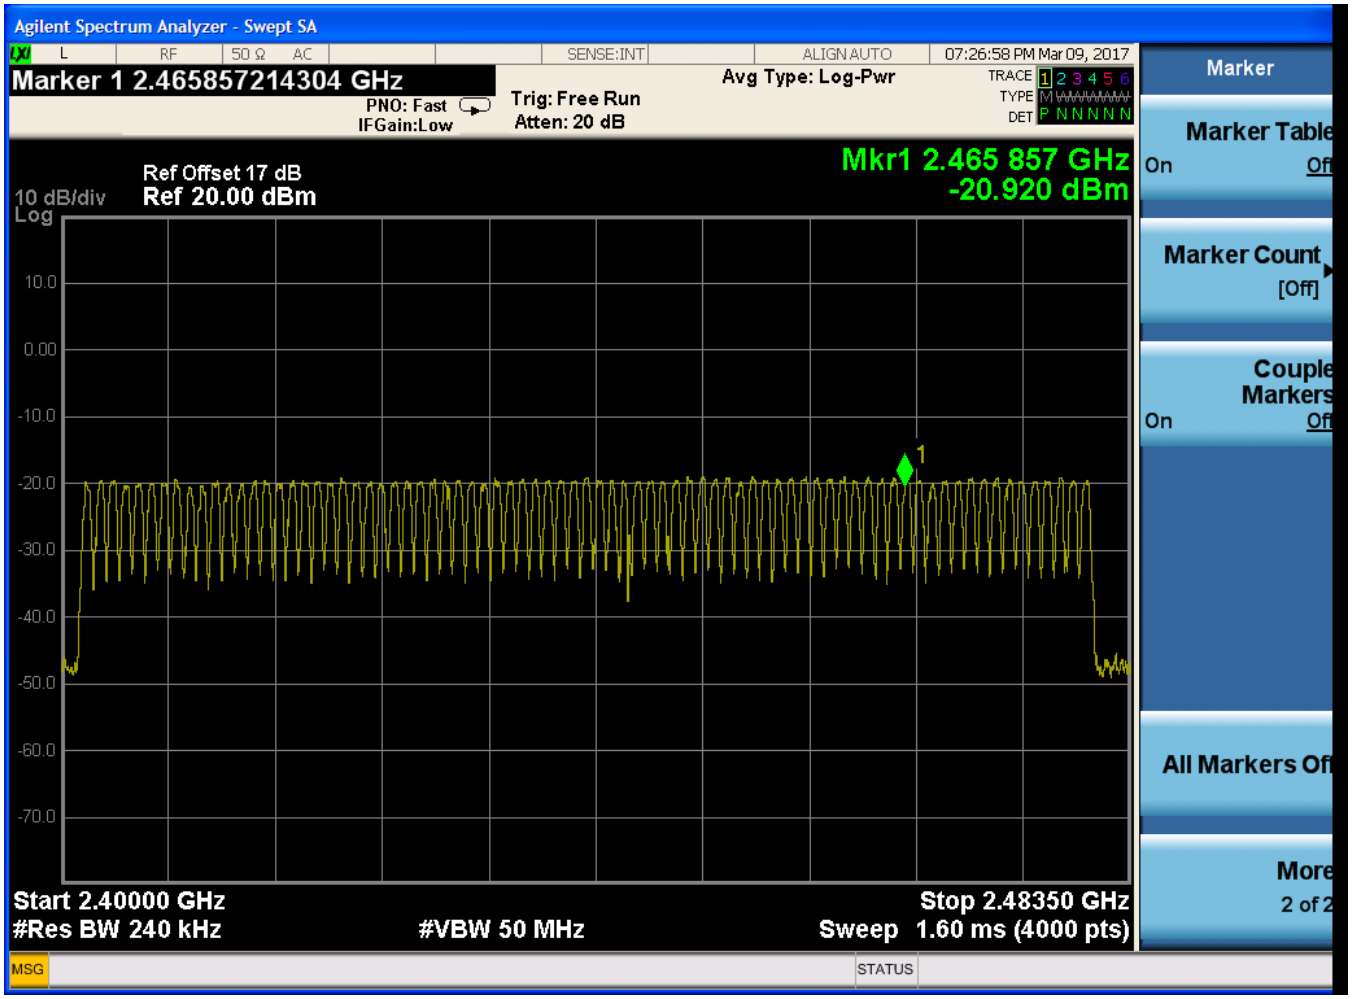
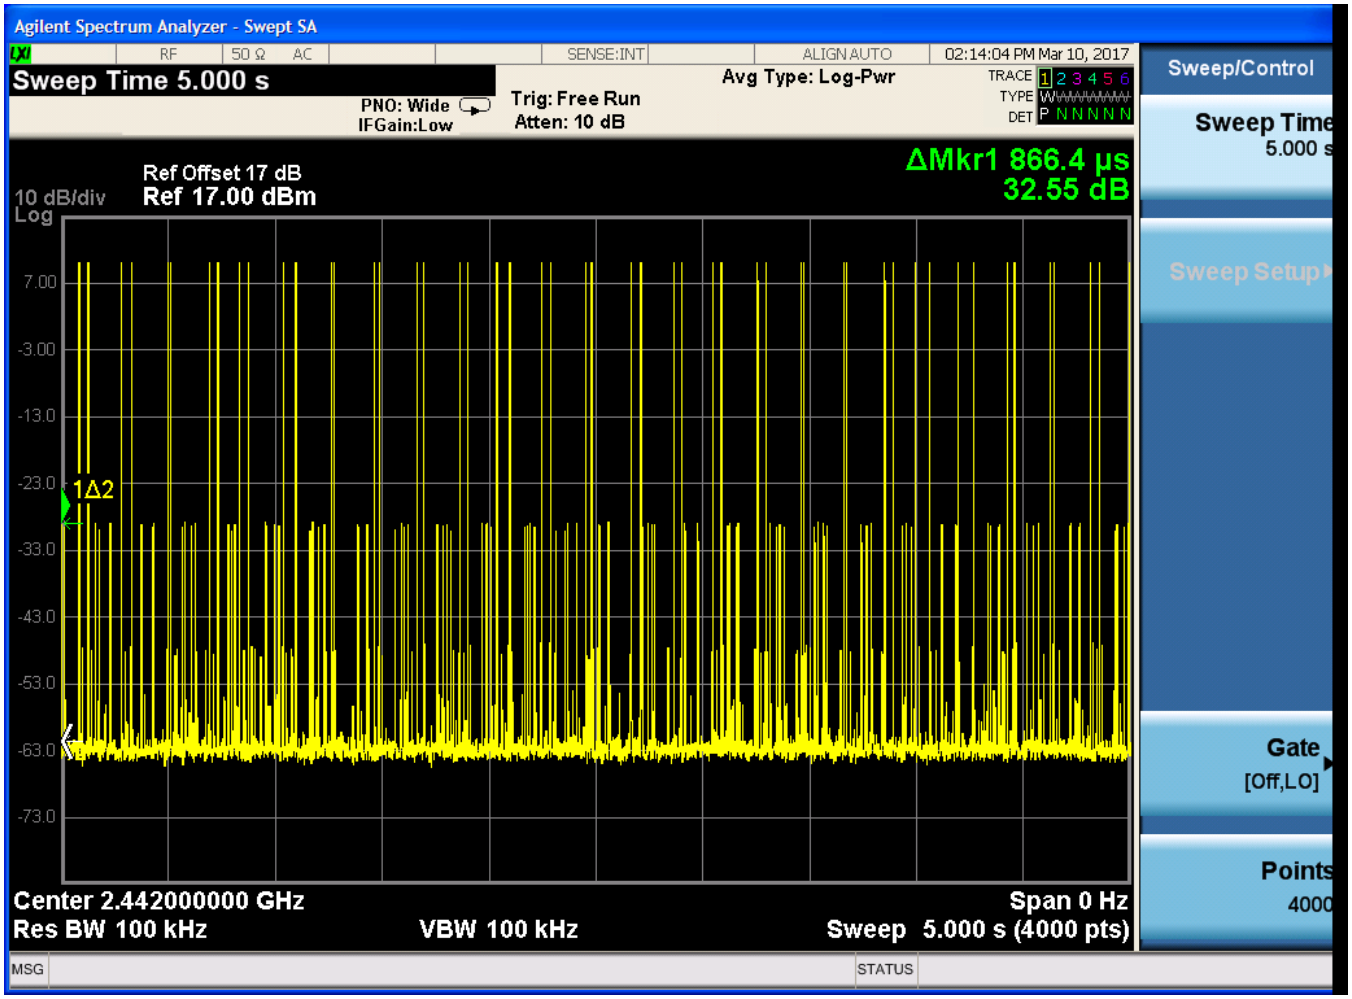


Dwell time is calculated by measuring the occupancy time of a single burst and extrapolating out to the period of 0.4 seconds X # of hopping channels employed.

Figure 3: Hopping On Time in 1 ms

Figure 4: Hopping over 5 minutes



An observation time of 5 seconds was selected to make the determination of the number of hops over the averaging time. In this case, 79 hops were counted in a span of 5 seconds. The averaging time is equal to 0.4Xnumber of channels.

Pulse on-time: 0.386ms
Hops in 5s: 79
Averaging time: 0.4s X number of channels: 0.4X78 = 31.2s
436.8 Hops per 31.2 s

Total On-time: 0.386 msX436.8 Hops = 0.168s

4.4 Output Power (FCC Part §2.1046)

Output power was measured by coupling the output of the EUT to the input of a spectrum analyzer. The spectrum analyzer was set with the RBW=1MHz and the VBW> RBW.

Table 5. BT Output Power

BT Mode			
Frequency MHz	Output Power dBm	Limit dBm	Pass/Fail
2402	8.6	30	Pass
2442	8.9	30	Pass
2480	8.9	30	Pass

Figure 5: Output Power Lower Channel BT Mode

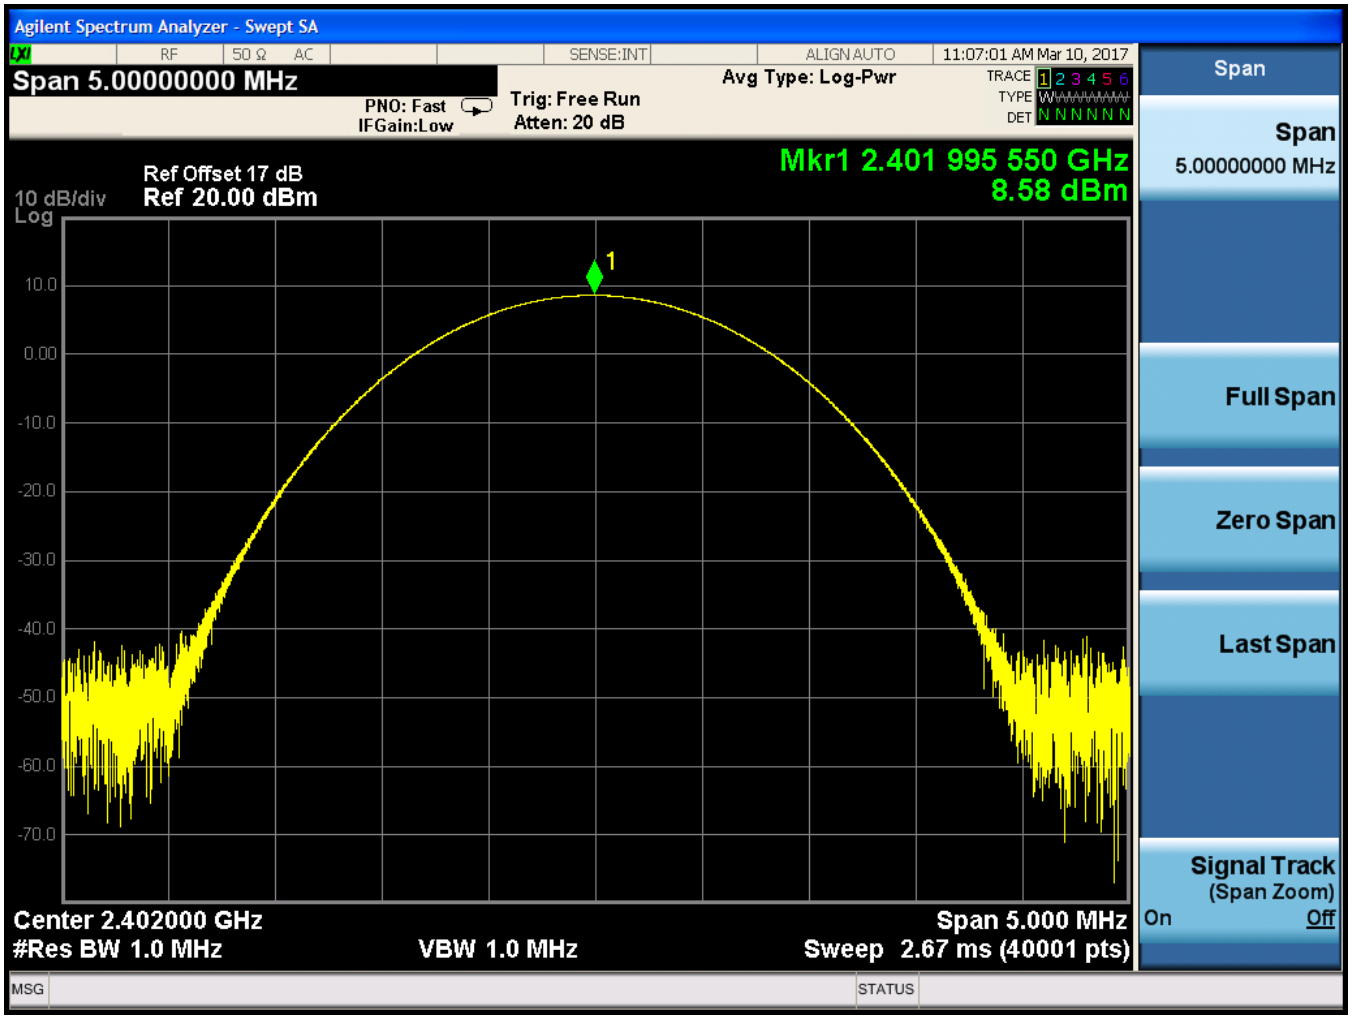


Figure 6: Output Power Middle Channel BT Mode

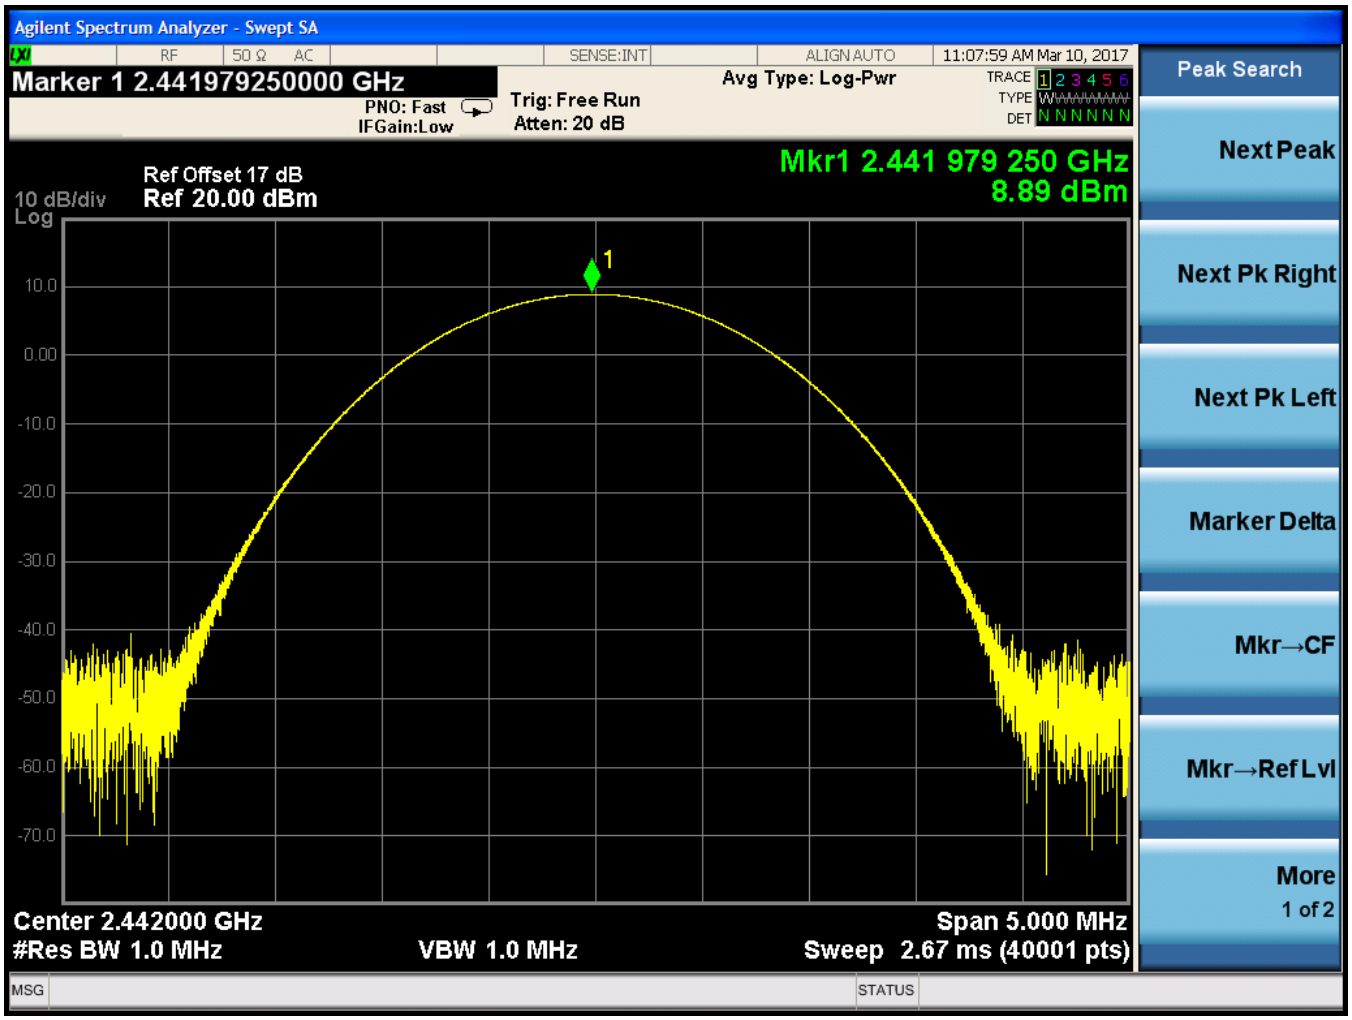

Figure 7: Output Power Upper Channel BT Mode

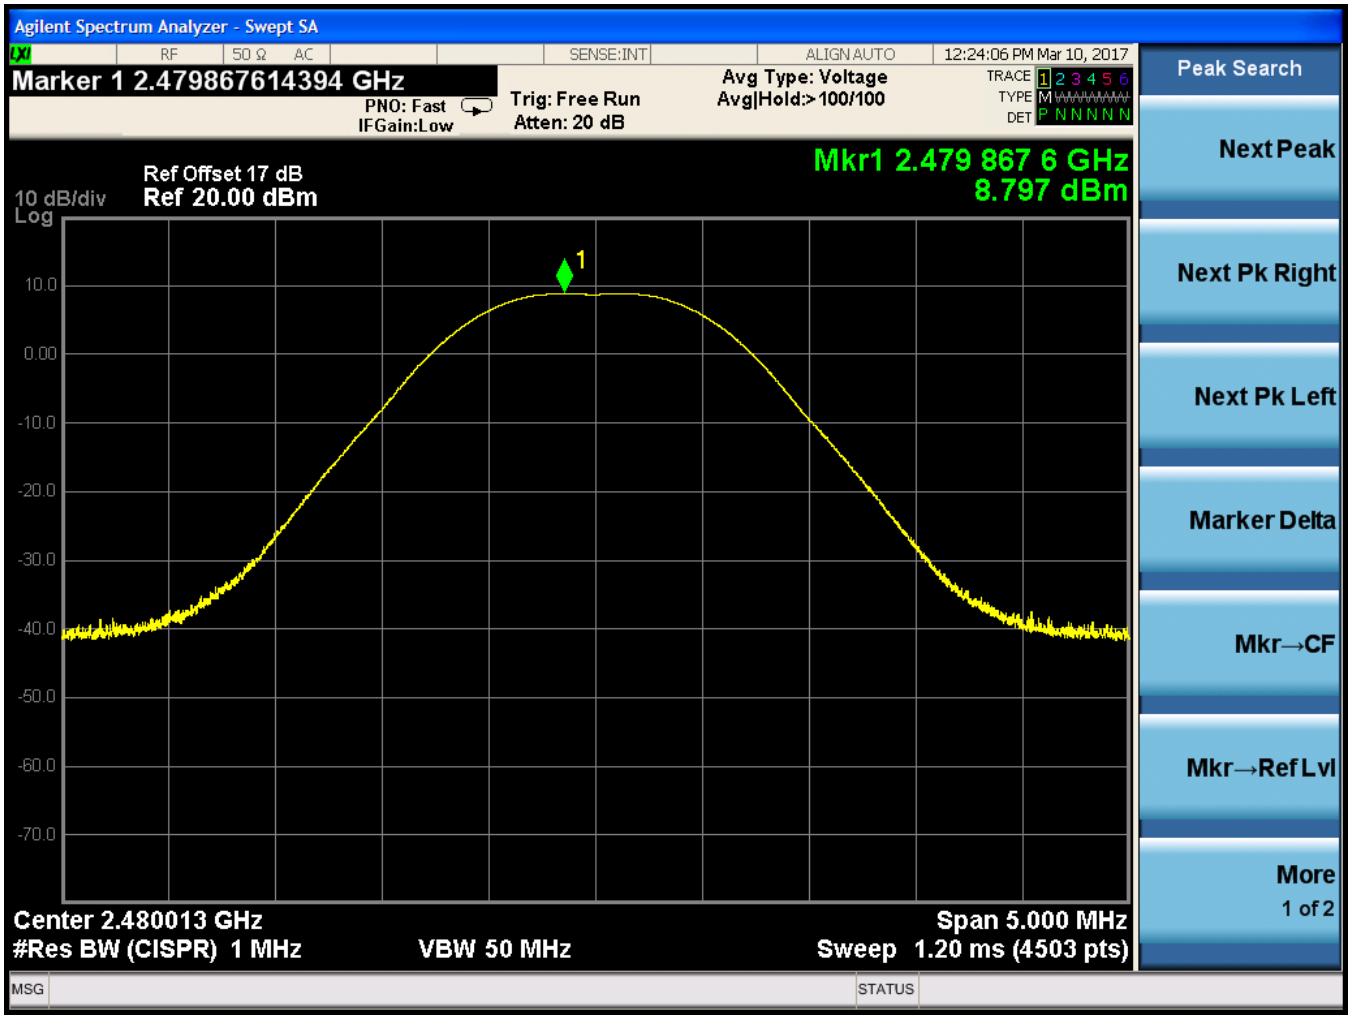

4.5 Occupied Bandwidth: (FCC Part §2.1049)

Occupied bandwidth was performed by coupling the output of the EUT to the input of a spectrum analyzer. **Table *6*** and **Table *7*** provide summaries of the Occupied Bandwidth Results.

Table 6: Occupied Bandwidth Results: Bluetooth Modes

Frequency MHz	Bandwidth MHz	Limit	Pass/Fail
2402	1.95	N/A	Pass
2442	1.96	N/A	Pass
2480	1.96	N/A	Pass

At full modulation, the occupied bandwidth was measured as shown:

Figure 8: Occupied Bandwidth Lower Channel Bluetooth Mode

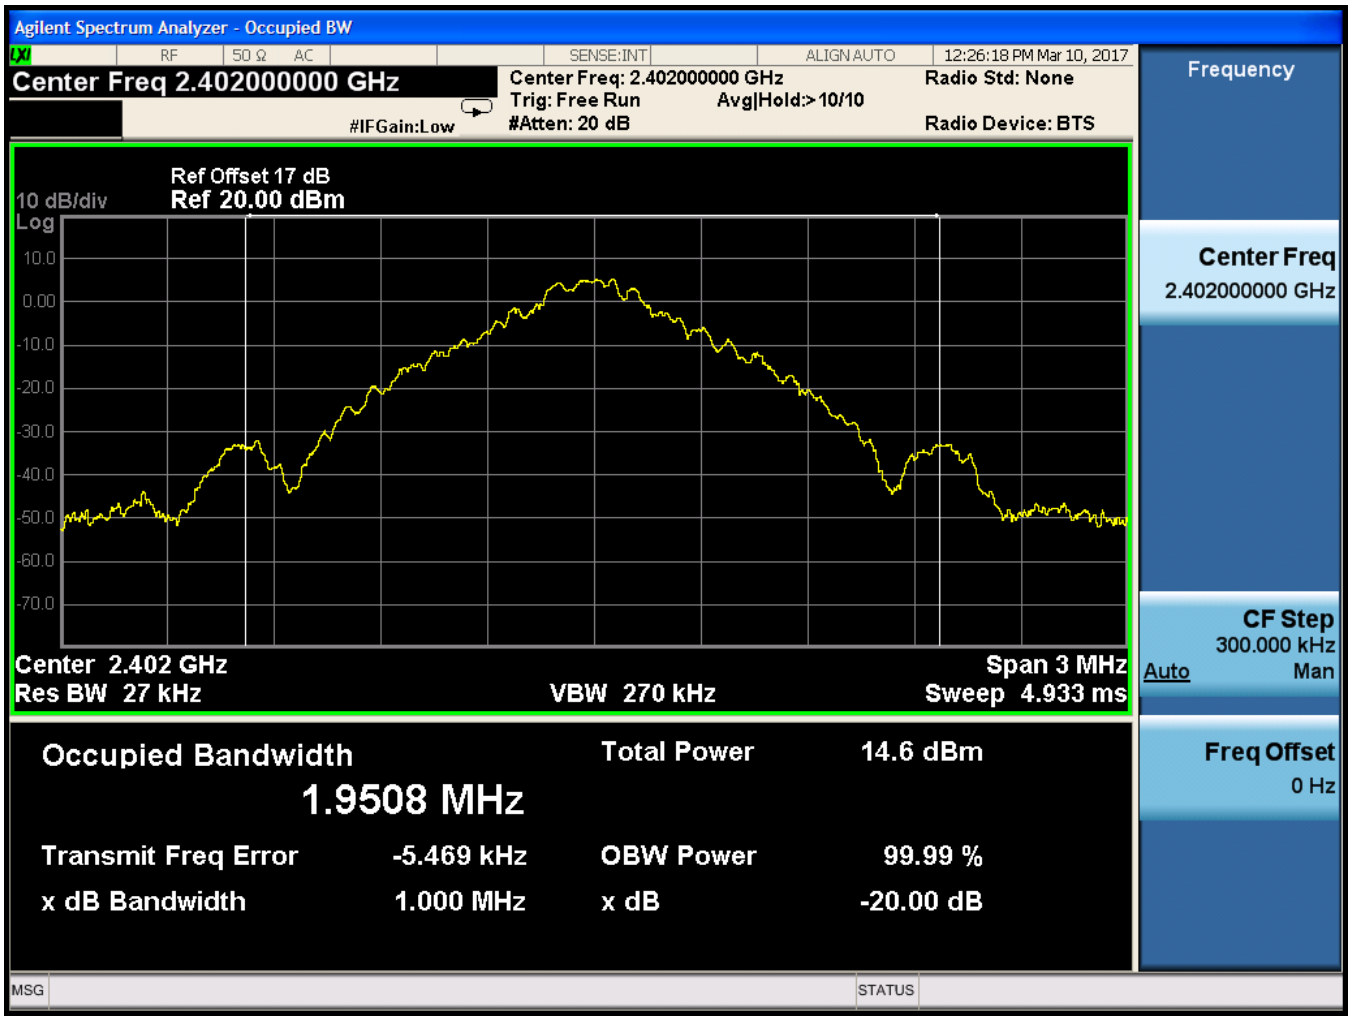

Figure 9: Occupied Bandwidth Middle Channel Bluetooth Mode

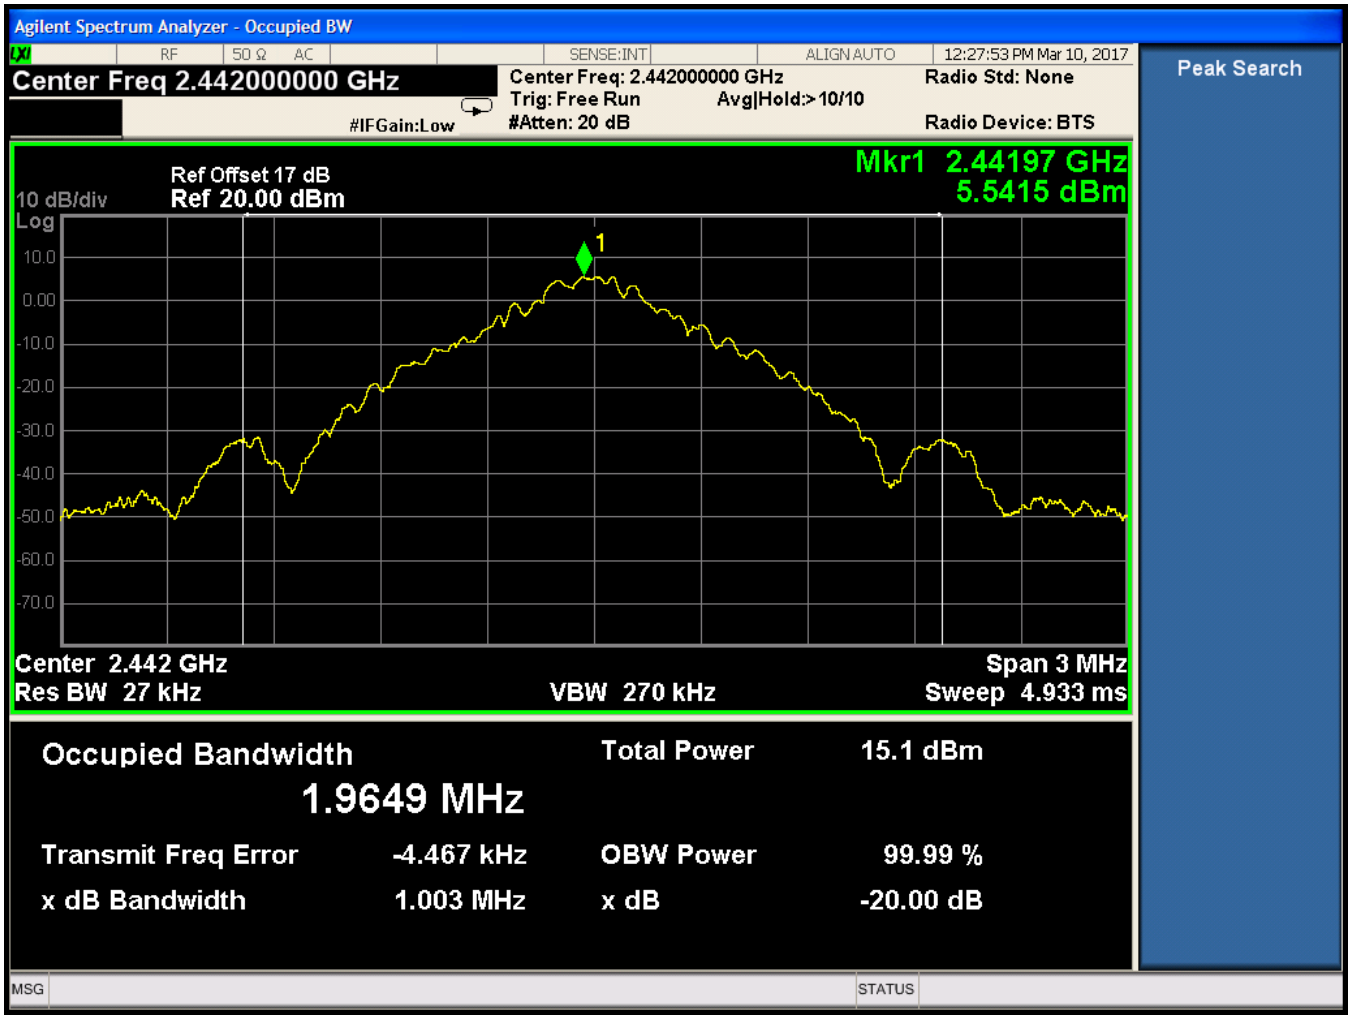

Figure 10: Occupied Bandwidth Upper Channel Bluetooth Mode

Table 7: Occupied Bandwidth Results: B Mode

B Mode			
Frequency MHz	Bandwidth MHz	Bit Rate Mbps	Pass/Fail
2412	9.2	11	Pass
2437	8.4	1	Pass
2462	9.7	2	Pass

At full modulation, the occupied bandwidth was measured as shown:

4.6 Spurious Emissions at Antenna Terminals (FCC Part §2.1051) and Band Edge Compliance

Spurious emissions at the antenna terminals were collected over the frequency range of 30MHz to 24.835GHz.

In addition, it is necessary for all emissions at the band edges be 20dB below the peak energy measured in a 100 kHz bandwidth. These data are shown in the following collection of plots.

Figure 11: Spurious Emissions BT Mode

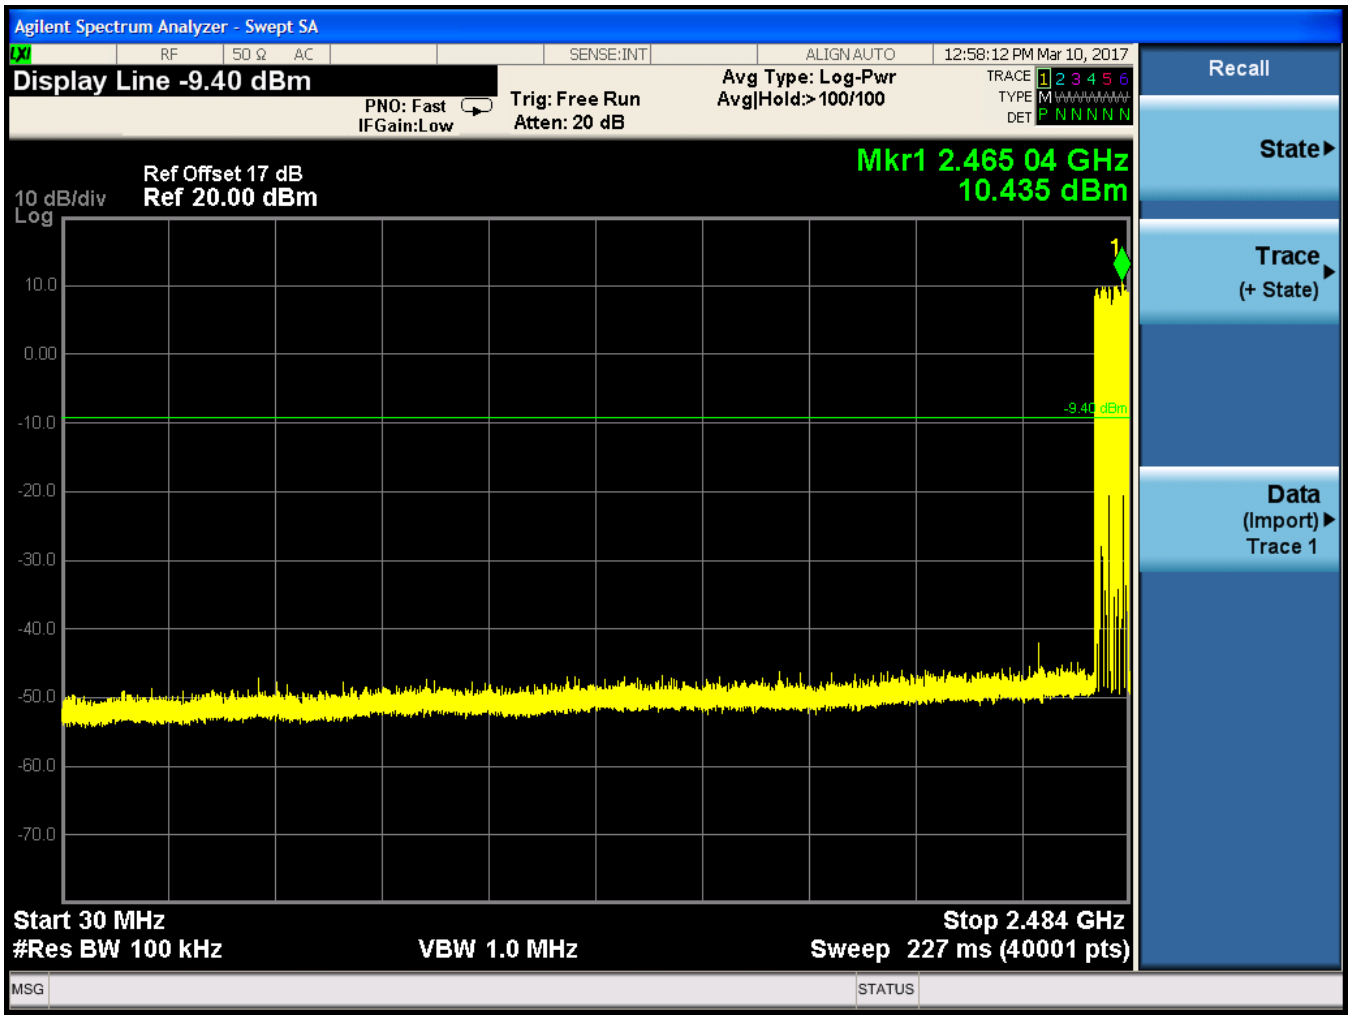

Figure 12: Spurious Emissions BT Mode

4.7 Radiated Emissions: (FCC Part §2.1053)

The EUT must comply with the radiated emission limits of 15.209. The limits are as shown in the following table.

4.7.1 Test Procedure

The EUT was placed on motorized turntable for radiated testing on a 3-meter open field test site. The emissions from the EUT were measured continuously at every azimuth by rotating the turntable. Receiving antennas were mounted on an antenna mast to determine the height of maximum emissions. The height of the antenna was varied between 1 and 4 meters. Cables were varied in position to produce maximum emissions. Both the horizontal and vertical field components were measured. Readings under 1000MHz were performed using a Quasi-Peak Detector function. Average readings were calculated based on the peak reading minus the Duty Cycle correction.

The emissions were measured using the following resolution bandwidths:

Frequency Range	Resolution Bandwidth	Video Bandwidth
30MHz-1000 MHz	120kHz	>100 kHz
>1000 MHz	1 MHz	1MHz (Peak)

Emissions were measured to the 10th harmonic of the transmit frequency. Worst-case emission levels are reported.

Emissions were also scanned from 30 MHz to 10X fundamental and compared with the 15.209 limits. **No detectable emissions were found aside from harmonics of the transmit frequency shown in the following table.**

The following is a sample calculation used in the data tables for calculating the final field strength of spurious emissions and comparing these levels to the specified limits.

Sample Calculation:

Spectrum Analyzer Voltage (SA Level): V dBµV

Antenna Factor (Ant Corr): AFdB/m

Cable Loss Correction (Cable Corr): CCdB

Duty Cycle Correction (Average) DCCdB

Amplifier Gain: GdB

Electric Field (Corr Level): EdBµV/m = VdBµV + AFdB/m + CCdB + DCCdB - GdB

Table 8: Radiated Emission Test Data. BT Mode Low Channel
