Frequency range tested: 9kHz-25GHz

Test Mode: Continuously Modulated

EUT is on a 0.8m test bench below 1GHz and a 1.5m high Styrofoam test bench above 1GHz.

EUT is investigated in Low, Middle, and High Channels, X, Y, & Z Axis with only the worst case reported.  
Vertical and Horizontal polarities investigated

EUT connected to support Laptop via USB cable.  
 EUT connected to support PoE box with 2 x Ethernet cables for power.  
 Support laptop connected to PoE box with 1 x Ethernet cable.  
 PoE box and support Laptop are located remotely.

No emissions observed within 20dB of limit from 18-25GHz, values provided are noise floor.

Method: ANSI C63.10 (2013)

Frequency range tested: 0.15-30MHz

XYZ EUT orientations investigated, worst case reported.

Below 30MHz, 3 x orthogonal axes investigated, above 30MHz, Horizontal and Vertical Antenna polarities investigated, worst case reported.

Investigated Radiated Spurious Emissions of Integrated Raspberry Pi 4 module while running the 2.4GHz Wi-Fi radio continuously. Customer was provided a worst case script of maximum power, running on Channel 1 (2412MHz) at worst case data rate for spurious emissions.

EUT connected to support laptop via USB cable.  
 EUT connected to support PoE box with 2 x Ethernet cables for power.

Method: ANSI C63.10 (2013)

Frequency range tested: 0.15-30MHz

XYZ EUT orientations investigated, worst case reported.

Below 30MHz, 3 x orthogonal axes investigated, above 30MHz, Horizontal and Vertical Antenna polarities investigated, worst case reported.

Investigated Radiated Spurious Emissions of Integrated Raspberry Pi 4 module while running the 5GHz Wi-Fi radio continuously. Customer was provided a worst case script of maximum power, running on Channel 36 (5180MHz) at worst case data rate for spurious emissions. Also investigated Channel 140 (5700MHz) but no emissions observed within 20dB of 15.209 limit.

EUT connected to support laptop via USB cable.  
 EUT connected to AC adapter for power.  
 EUT connected to support Laptop via Ethernet cable.  
 Laptop is located remotely. (Configuration 2)

 EUT connected to support PoE box with 2 x Ethernet cables for power.  
 Support laptop connected to PoE box with 1 x Ethernet cable.  
 PoE box and support Laptop are located remotely.  
  
 The manufacturer declares the other power configuration is unlikely to affect the Radiated Spurious Emissions of the 2.4GHz WiFi from the module, however, AC emissions will be run in both PoE and AC Adapter configurations.  
  
**No emissions observed above 18GHz, values provided are noise floor.**

Temperature: 20-25°C  
 Humidity: 30-36%  
 Pressure: 101-102kPa  
  
 Method: ANSI C63.10 (2013)  
  
 Frequency range tested: 9kHz-40GHz  
  
 XYZ EUT orientations investigated, worst case reported.  
  
 Below 30MHz, 3 x orthogonal axes investigated, above 30MHz, Horizontal and Vertical Antenna polarities investigated, worst case reported.  
  
 Investigated Radiated Spurious Emissions of Integrated Raspberry Pi 4 module while running the 5GHz Wi-Fi radio continuously. Customer was provided a worst case script of maximum power, running on Channel 36 (5180MHz) at worst case data rate for spurious emissions. Also investigated Channel 140 (5700MHz) but no emissions observed within 20dB of 15.209 limit.  
  
 EUT connected to support laptop via USB cable.  
 EUT connected to support PoE box with 2 x Ethernet cables for power.  
 Support laptop connected to PoE box with 1 x Ethernet cable.  
 PoE box and support Laptop are located remotely.  
  
 The manufacturer declares the other power configuration is unlikely to affect the Radiated Spurious Emissions of the 5GHz WiFi from the module, however, AC emissions will be run in both PoE and AC Adapter configurations.  
  
**No emissions observed above 18GHz, values provided are noise floor.**

# SUPPLEMENTAL INFORMATION

## Measurement Uncertainty

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

Uncertainties reported are worst case for all CKC Laboratories’ sites and represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2. Compliance is deemed to occur provided measurements are below the specified limits.

## Emissions Test Details

**TESTING PARAMETERS**

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

**CORRECTION FACTORS**

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in dBµV/m, the spectrum analyzer reading in dBµV was corrected by using the following formula. This reading was then compared to the applicable specification limit. Individual measurements were compared with the displayed limit value in the margin column. The margin was calculated based on subtracting the limit value from the corrected measurement value; a positive margin represents a measurement exceeding the limit, while a negative margin represents a measurement less than the limit.

SAMPLE CALCULATIONS		
	Meter reading	(dBµV)
+	Antenna Factor	(dB/m)
+	Cable Loss	(dB)
-	Distance Correction	(dB)
-	Preamplifier Gain	(dB)
=	Corrected Reading	(dBµV/m)

**TEST INSTRUMENTATION AND ANALYZER SETTINGS**

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz

**SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS**

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or caret ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

**Peak**

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

**Quasi-Peak**

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

**Average**

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point, the measuring device is set into the linear mode and the scan time is reduced.
