<b>Test Results</b>	Pass							
<p>UL International (UK) Ltd. tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by UL International (UK) Ltd. based on interpretations and/or observations of test results. Measurement Uncertainties are in accordance with the above standard and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.</p> <p><b>Note:</b> The results documented in this report apply only to the tested sample(s), under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by UL International (UK) Ltd. and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL International (UK) Ltd. will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by UKAS. This report is written to support regulatory compliance of the applicable standards stated above.</p>

## **2. Test Specification, Methods and Procedures**

### **2.1. Test Specification**

<b>Reference:</b>	<b>KDB Publication Number: 865664 D01 SAR Measurement 100 MHz to 6 GHz</b>
<b>Title:</b>	SAR Measurement Requirements for 100 MHz to 6 GHz
<b>Introduction:</b>	The SAR Measurement procedures for 100MHz to 6GHz are described in this document. Field probes, tissue dielectric properties, SAR scans, measurement accuracy and variability of the measured results are discussed. The field probe and SAR scan requirements are derived from criteria considered in standard IEC/IEEE 62209-1528:2020. The wireless product and technology specific procedures in applicable KDB publications are required to be used unless further guidance has been approved by the FCC.
<b>Purpose of Test:</b>	To determine if the Equipment Under Test complies with the Specific Absorption Rate for general population/uncontrolled exposure limit of 1.6 W/kg as specified in FCC 47 CFR part 2 (2.1093).

### **2.2. Methods and Procedures Reference Documentation**

The methods and procedures used were as detailed in:

**IEC/IEEE 62209-1528: 2020**

Measurement procedure for the assessment of specific absorption rate of human exposure to radio frequency fields from hand-held and body-mounted wireless communication devices.

**FCC KDB Publication:**

- KDB 248227 D01 802.11 Wi-Fi SAR v02r02
- KDB 447498 D03 Supplement C Cross-Reference v01
- KDB 447498 D04 Interim General RF Exposure Guidance v01
- KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz v01r04
- KDB 865664 D02 RF Exposure Reporting v01r02

### **2.3. Definition of Measurement Equipment**

The measurement equipment used complied with the requirements of the standards referenced in the methods & procedures section above. Section 4.3 contains a list of the test equipment used.

### **3.Facilities and Accreditation**

The measurement facilities used to collect data are located at

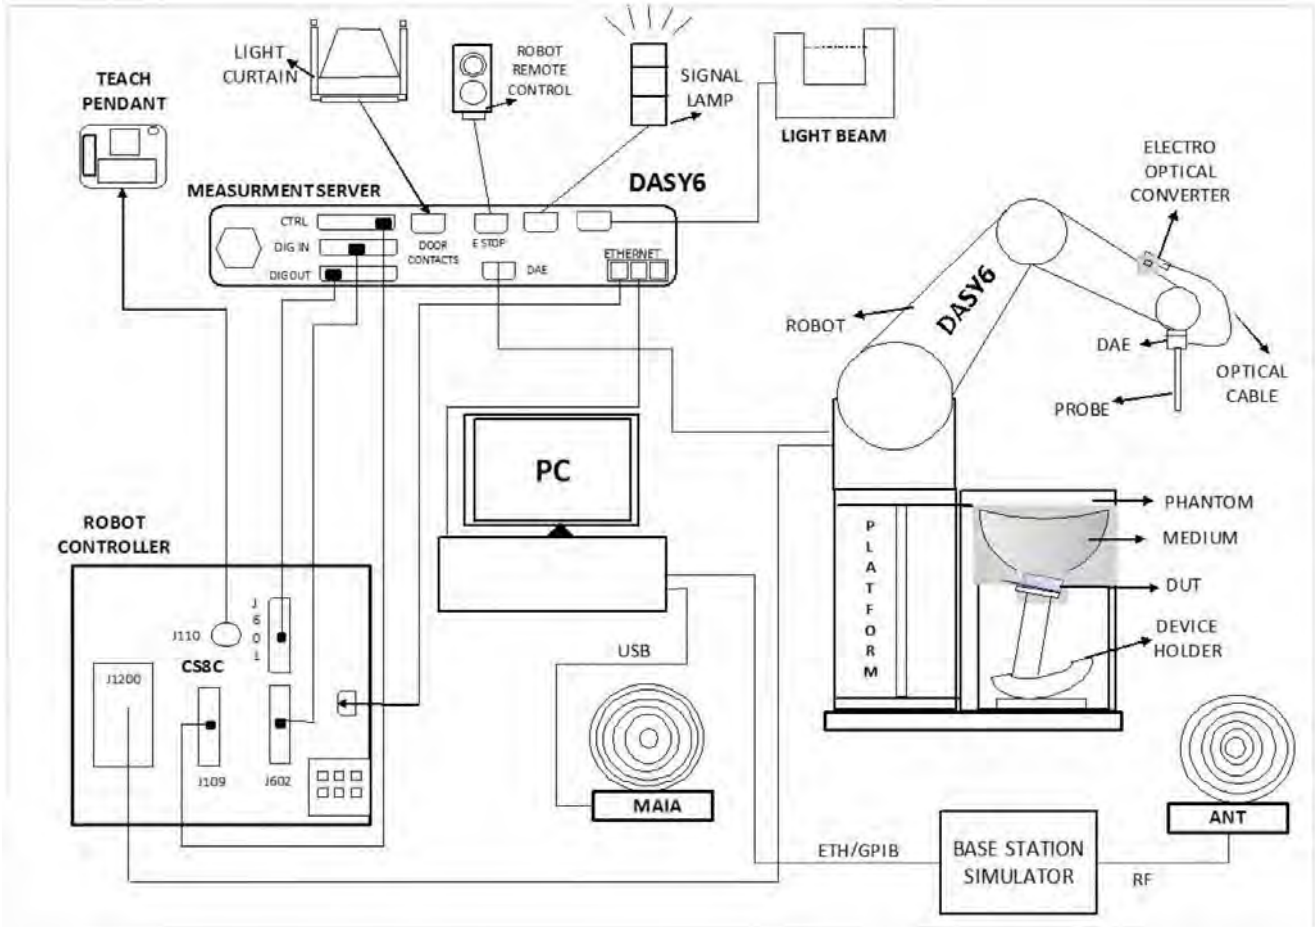

Horizon Unit 1-4, Wade Road, Kingsland Business Park, Basingstoke, Hampshire, RG24 8AH, UK	Facility Type
SAR Lab 66	Controlled Environment Chamber
SAR Lab 67	Controlled Environment Chamber

UL International (UK) Ltd is accredited by UKAS (United Kingdom Accreditation Service, Accredited to ISO/IEC 17025:2005), Laboratory UKAS Code 5772.

## 4. SAR Measurement System & Test Equipment

### 4.1. SAR Measurement System

The DASY test systems used for performing compliance tests consists of the following items:

- A standard high precision 6-axis robot with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
- An isotropic Field probe optimized and calibrated for the targeted measurement.
- A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The Electro-optical converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. To use optical surface detection, a special version of the EOC is required. The EOC signal is transmitted to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- A computer running Win10 with DASY software installed.
- Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.
- The phantom, the device holder and other accessories according to the targeted measurement.

## **4.2. SAR Measurement Procedure**

### **4.2.1. Normal SAR Measurement Procedure**

The following procedure shall be performed for each of the test conditions

- a) Measure the local SAR at a test point within 8 mm of the phantom inner surface that is closest to the DUT.
- b) Measure the two-dimensional SAR distribution within the phantom (area scan procedure). The boundary of the measurement area shall not be closer than 20 mm from the phantom side walls. The distance between the measurement points should enable the detection of the location of local maximum with an accuracy of better than half the linear dimension of the tissue cube after interpolation. A maximum grid spacing of 20 mm for frequencies below 3 GHz and  $(60/f \text{ [GHz]})$  mm for frequencies of 3 GHz and greater is recommended. The maximum distance between the geometrical centre of the probe detectors and the inner surface of the phantom shall be 5 mm for frequencies below 3 GHz and  $\delta \ln(2)/2$  mm for frequencies of 3 GHz and greater, where  $\delta$  is the plane wave skin depth and  $\ln(x)$  is the natural logarithm. The maximum variation of the sensor-phantom surface distance shall be  $\pm 1$  mm for frequencies below 3 GHz and  $\pm 0,5$  mm for frequencies of 3 GHz and greater. At all measurement points the angle of the probe with respect to the line normal to the surface should be less than  $5^\circ$ . If this cannot be achieved for a measurement distance to the phantom inner surface shorter than the probe diameter, additional uncertainty evaluation is needed.
- c) From the scanned SAR distribution, identify the position of the maximum SAR value, in addition identify the positions of any local maxima with SAR values within 2 dB of the maximum value that will not be within the zoom scan of other peaks; additional peaks shall be measured only when the primary peak is within 2 dB of the SAR compliance limit (e.g., 1 W/kg for 1,6 W /kg 1 g limit, or 1,26 W/kg for 2 W /kg, 10 g limit).
- d) Measure the three-dimensional SAR distribution at the local maxima locations identified in step c) (zoom For frequencies at or below 3 GHz, the following procedure shall be applied: The horizontal grid step shall be 8 mm or less. The grid step in the vertical direction shall be 5 mm or less if uniform spacing is used. If variable spacing is used in the vertical direction, the maximum spacing between the two closest measured points to the phantom shell (M1 and M2) shall be 4 mm or less and the spacing between farther points shall increase by a factor of 1,5 or less. The minimum size of the zoom scan volume shall be 30 mm by 30 mm by 30 mm

For frequencies above 3 GHz, the minimum size of the zoom scan volume may be reduced to 22 mm by 22 mm by 22 mm. The horizontal grid step shall be  $(24/f \text{ [GHz]})$  mm or less. If uniform spacing in the vertical direction is used, the grid step in the vertical direction shall be  $(10/(f \text{ [GHz]} - 1))$  mm or less. If variable spacing is used in the vertical direction, the maximum spacing between the two measured points closest to the phantom shell shall be  $(12/f \text{ [GHz]})$  mm or less and the spacing between further points shall increase by a factor of 1,5 or less. For other parameters, see Zoom Scan Parameters table.

When the highest 1 g or 10 g cube is touching the boundary of a zoom-scan volume, the entire zoom scan shall be repeated with the new centre located at the maximum psSAR location indicated by the preceding zoom scan measurement. If the zoom scan measured as defined above complies with both of the following criteria, or if the peak spatial-average SAR is below 0,1 W/kg, no additional measurements are needed:

1) the smallest horizontal distance from the local SAR peaks to all points 3 dB below the SAR peak shall be larger than the horizontal grid steps in both x and y directions ( $\Delta x$ ,  $\Delta y$ ). This shall be checked for the measured zoom scan plane conformal to the phantom at the distance  $z_{M1}$ . The minimum distance shall be recorded in the SAR test report;

2) the ratio of the SAR at the second measured point (M2) to the SAR at the closest measured point (M1) at the x-y location of the measured maximum SAR value shall be at least 30 %. This ratio (in %) shall be recorded in the SAR test report.

If one or both of the above criteria are not met, the zoom scan measurement shall be repeated using a finer resolution while keeping the other zoom scan parameters compatible with Zoom Scan Parameters table. New horizontal and vertical grid steps shall be determined from the measured SAR distribution so that the above criteria are met. Compliance with the above two criteria shall be demonstrated for the new measured zoom scan. The size of the higher resolution zoom scan and other parameters of Zoom Scan Parameters table shall apply. The closest point to the phantom shell shall be 2 mm or less for graded grids and the grading factor shall be 1,5 or less.

Uncertainties due to field distortion between the media boundary and the dielectric enclosure of the probe should also be minimized, which is achieved if the distance between the phantom surface and physical tip of the probe is larger than the probe tip diameter. Other methods may utilize correction procedures to compensate for boundary effects that enable high precision measurements closer than half the probe diameter. For all measurement points, the angle of the probe normal to the flat phantom surface shall be less than 5°.

**Zoom Scan Parameters**

Parameter	DUT transmit frequency being tested	
	$f \leq 3$ GHz	$3$ GHz $< f \leq 6$ GHz
Maximum distance between the closest measured points and the phantom surface ( $z_{M1}$ in Figure 14 and Table 2, in mm)	5	$\delta \ln(2)/2^a$
Maximum angle between the probe axis and the flat phantom surface normal ( $\alpha$ in Figure 14)	5°	5°
Maximum spacing between measured points in the x- and y-directions ( $\Delta x$ and $\Delta y$ , in mm)	8	$24/f^{b,c}$
For uniform grids: Maximum spacing between measured points in the direction normal to the phantom shell ( $\Delta z_1$ in Figure 14, in mm)	5	$10/(f - 1)$
For graded grids: Maximum spacing between the two closest measured points in the direction normal to the phantom shell ( $\Delta z_1$ in Figure 14, in mm)	4	$12/f$
For graded grids: Maximum incremental increase in the spacing between measured points in the direction normal to the phantom shell ( $R_z = \Delta z_2/\Delta z_1$ in Figure 14)	1,5	1,5
Minimum edge length of the zoom scan volume in the x- and y-directions ( $L_z$ in 7.2.5.3, in mm)	30	22
Minimum edge length of the zoom scan volume in the direction normal to the phantom shell ( $L_h$ in 7.2.5.3, in mm)	30	22
Tolerance in the probe angle	1°	1°
<p><sup>a</sup> <math>\delta</math> is the penetration depth for a plane-wave incident normally on a planar half-space.</p> <p><sup>b</sup> This is the maximum spacing allowed, which may not work for all circumstances.</p> <p><sup>c</sup> <math>f</math> is the frequency in GHz.</p>		

- e) Use post processing (e.g. interpolation and extrapolation) procedures to determine the local SAR values at the spatial resolution needed for mass averaging.
- f) The local SAR should be measured at the same location as in Step a). SAR drift is assessed and reported in the uncertainty budget.

In the event that the evaluation of measurement drift exceeds the 5 % tolerance, it is required that SAR be reassessed following guidelines contained within this standard.

If the drift is larger than 5 %, then the measurement drift shall be considered a bias, not an uncertainty. A correction shall be applied to the measured SAR value. It is not necessary to record the drift in the uncertainty budget (i.e.  $u_i = 0$  %). The uncertainty budget reported in a measurement report should correspond to the highest SAR value reported (after correction, if applicable). Alternatively, the uncertainty budget reported should cover all measurements, i.e., it should report a conservative value.

### 4.3. Test Equipment

Measuring equipment used to perform the tests is documented in this report and has been calibrated in accordance with UKAS' recommendations and is traceable to recognized national standards.

## **5. Measurement Uncertainty**

No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently, the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor, such that a confidence level of approximately 95% is maintained. For the purposes of this document “approximately” is interpreted as meaning “effectively” or “for most practical purposes”.

Test Name	Confidence Level	Calculated Uncertainty
Uncertainty- Freq. 300 MHz - 3 GHz Head & Body Configuration 1g	95%	±25.42%
Uncertainty- Freq. 300 MHz - 3 GHz Head & Body Configuration 10g	95%	±25.33%

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty, the published guidance of the appropriate accreditation body is followed.

## 6. Equipment Under Test (EUT)

### 6.1. Description of Equipment Under Test (EUT)

<b>Serial Number:</b>	Conducted Sample(s)	Sample #2: reference Serial 02
	Radiated Sample(s)	Sample #1: W100C24309060 Sample #3: reference Serial 03
<b>Hardware Version Number:</b>	CA10-1108 v00	
<b>Software Version Number:</b>	CS02-1103: Victoria 3.0 (WiFi) - Handset Software: (v1.01)	
<b>Firmware Version Number:</b>	Test firmware provided by module manufacturer	
<b>Country of Manufacture:</b>	UK	
<b>Date of Receipt:</b>	12 May 2023	
<b>DUT Description:</b>	<p>The Device Under Test is a hand-held device for home use. The DUT supports WiFi 2.4 GHz (IEEE 802.11b/g/n) and Bluetooth 2.4 GHz radio, it allows the end user to connect to Wi-Fi using the app and it can send reminders, feedback.</p> <p>The DUT is a handheld device with three different smart head options (refer section 12).</p>	
<b>Operating Configurations</b>	Head Body-worn Extremity	
<b>Device dimension</b>	Overall (Length x Width x Depth): 185 mm x 60 mm x 70 mm	
<b>Battery Type</b>	<input type="checkbox"/> Standard – Lithium-ion battery <input type="checkbox"/> Extended (large capacity)	

**6.2. Wireless Technologies**

Wireless technologies	Frequency bands	Operating mode	Duty Cycle
Wi-Fi	2.4 GHz	802.11b 802.11g 802.11n HT20 / HT40	100%

			19	Middle	2440.0
			38	High	2478.0

**Additional Information Related to Testing:**

<b>Antenna Type:</b>	Internal integral
<b>Antenna Lengths:</b>	As specified in <b>Appendix 12.1</b>

Number of Antennas:	Antenna Type	Antenna Description	Type
	WLAN / WPAN	Wi-Fi 2.4GHz / Bluetooth 2.4GHz	1 fixed (Internal)

**6.3.Nominal and Maximum Output power:**

**6.3.1.Wi-Fi 2.4 GHz**

RF Air interface	Mode	Channel Nos.	Target + Max. Tolerances (dBm)	
			Low Data Rate	High Data Rate
Wi-Fi 2.4 GHz	802.11b	All	12.50	12.50
	802.11g	All	11.00	7.00
	802.11n HT20 / HT40	All	11.00	6.00

Note(s):

**6.3.2.Bluetooth 2.4 GHz**

RF Air interface	Mode	Channel Nos.	Target + Max. Tolerances (dBm)
Bluetooth 2.4 GHz	BLE	All	4.00

Note(s):

## **7. RF Exposure Conditions (Test Configurations)**

### **7.1. Configuration Consideration**

Technology Port	Configuration	DUT-to-User Separation	Position	Antenna-to-Edge Separation (mm)	Evaluation Considered
Wi-Fi 2.4 / Bluetooth 2.4	Head	0mm	Top (Applied Part)	< 75	Yes
	Body-worn	0mm	Top (Applied Part)	< 75	Yes
	Extremity	0mm	Front	< 75	Yes
			Back	< 75	Yes
			Left	< 75	Yes
			Right	< 75	Yes
			Top (Applied Part)	< 75	Yes
			Back@Head	< 75	Yes

### **Notes**

1. The Antenna to edge separation distances are indicated in the 'Antenna Schematics' located in Section 12.1 of this report.
2. Prior to the SAR testing, KDB inquiry was raised with FCC for test approach/plan, all the configuration and position to be evaluated were agreed.

**7.2. SAR Test Exclusion Consideration**

Frequency Band	Configuration(s)
	Head / Body-worn / Extremity
WLAN 2.4GHz	No
Bluetooth 2.4GHz	No

**Note:**

1. As per KDB 4474898 D04, the frequency bands with rated power including upper tolerance, which qualify for Standalone Test Exclusion, are as per the above table.
2. The details for the Maximum Rated Power and tolerance(s) can be found in section 6.

## 8. Conducted output power measurements

### 8.1. RF Output Average Power Measurement: Wi-Fi 2.4 GHz

Channel Number	Frequency (MHz)	Avg Power (dBm)	Operating Mode
1	2412.0	11.85	802.11b (1 Mbps)
6	2437.0	11.75	
11	2462.0	11.60	
12	2467.0	Not Supported	
13	2472.0	Not Supported	

**Note:**

- Conducted power measurements on 802.11g and 802.11n HT20 modes were not performed as max. rated power including tolerance is equal or lower than other modes.

### 8.2. RF Output Average Power Measurement: Bluetooth 2.4 GHz

Channel Number	Frequency (MHz)	Avg Power (dBm)	Operating Mode
0	2402.0	3.60	BLE (DH5)
19	2440.0	3.55	
39	2480.0	3.60	

**Note:**

## **9. Dielectric Property Measurements & System Check**

### **9.1. Tissue Dielectric Parameters**

The temperature of the tissue-equivalent medium used during measurement must also be within 18°C to 25°C and within  $\pm 2^\circ\text{C}$  of the temperature when the tissue parameters are characterized.

The dielectric parameters must be measured before the tissue-equivalent medium is used in a series of SAR measurements. The parameters should be re-measured after each 3 – 4 days of use; or earlier if the dielectric parameters can become out of tolerance; for example, when the parameters are marginal at the beginning of the measurement series.

Tissue dielectric parameters were measured at the low, middle and high frequency of each operating frequency range of the test device.

**IEC/IEEE 62209-1528:2020**

Target Frequency (MHz)	Head	
	$\epsilon_r$	$\sigma$ (S/m)
4	55.00	0.75
13	55.00	0.75
30	55.00	0.75
150	52.30	0.76

4000	37.40	3.43
4500	36.80	3.94
5000	36.20	4.45
5100	36.10	4.55
5200	36.00	4.66
5250	35.90	4.71
5300	35.90	4.76
5400	35.80	4.86
5500	35.60	4.96
5600	35.50	5.07
5700	35.40	5.17
5750	35.40	5.22
5800	35.30	5.27
6000	35.10	5.48
6500	34.50	6.07
7000	33.90	6.65
7500	33.30	7.24
8000	32.70	7.84
8500	32.10	8.46
9000	31.60	9.08
9500	31.00	9.71
10000	30.40	10.40

**NOTE:** For convenience, permittivity and conductivity values at some frequencies that are not part of the original data from Drossos et al. [B60] or the extension to 5800 MHz are provided (i.e., the values shown in italics). These values were linearly interpolated between the values in this table that are immediately above and below these values, except the values at 6000 MHz that were linearly extrapolated from the values at 3000 MHz and 5800 MHz.

## **9.2. System Check**

SAR system verification is required to confirm measurement accuracy, according to the tissue dielectric media, probe calibration points and other system operating parameters required for measuring the SAR of a test device. The system verification must be performed for each frequency band and within the valid range of each probe calibration point required for testing the device. The same SAR probe(s) and tissue-equivalent media combinations used with each specific SAR system for system verification must be used for device testing. When multiple probe calibration points are required to cover substantially large transmission bands, independent system verifications are required for each probe calibration point. A system verification must be performed before each series of SAR measurements using the same probe calibration point and tissue-equivalent medium. Additional system verification should be considered according to the conditions of the tissue-equivalent medium and measured tissue dielectric parameters, typically every three to four days when the liquid parameters are re-measured or sooner when marginal liquid parameters are used at the beginning of a series of measurements.

## **9.3. Numerical SAR Target Values**

The numerical SAR target values are obtained from the reference standards. The measured values are normalised to 1 Watt.

System Dipole	Freq. (MHz)	Numerical SAR Target Values (W/kg)	
		1g/10g	Head
D2450V2	2450	1g	52.40
		10g	24.00

**9.4. Dielectric Property Measurements & System Check Results**

The 1-g SAR and 10-g SAR measured with a reference dipole, using the required tissue-equivalent medium at the test frequency, must be within ±10% of the manufacturer calibrated dipole SAR target and ±15% of the numerical target.

## **10. Measurements, Examinations and Derived Result**

### **10.1. Specific Absorption Rate - Test Results**

#### **Test Approach**

The SAR test is evaluated on each mode / configuration (Configuration: Head, Body-worn and extremity) on the channel measuring the highest average output power, in each frequency band (i.e.: DTS)

In the cases where the different channel bandwidth modes have the same highest measured average power, the largest channel bandwidth configuration has been selected.

#### **Note:**

1. SAR values represented by “-“ indicate no SAR peaks were detected during Area / Zoom Scans.
2. SAR test were performed using the ‘standard battery’ pack, as this will give provide most conservative configuration setup.

### 10.1.1.WLAN 2.4GHz 1g – Head

Max Reported SAR = 0.02 (W/kg)

Mode	Dist. (mm)	EUT Position	Channel Number	Freq (MHz)	Power (dBm)		1g: SAR Results (W/kg)		Notes	Plot No.
					Tune Up Limit	Meas.	Meas. SAR Level	Reported SAR

2. Spot test worst Case measurements with 'smart head #2'
3. Spot test worst Case measurements with 'smart head #3'

### 10.1.4. Bluetooth 2.4GHz 1g – Head

Max Reported SAR = 0.01 (W/kg)

Mode	Dist. (mm)	EUT Position	Channel Number	Freq (MHz)	Power (dBm)		1g: SAR Results (W/kg)		Notes	Plot No.
					Tune Up Limit	Meas.	Meas. SAR Level	Reported SAR		
BLE	0	Top (Applied Part)	0	2402	4.00	3.60	0.01	0.01	1	-
BLE	0	Top (Applied Part)	19	2440	4.00	3.55	0.01	0.01	1	-
BLE	0	Top (Applied Part)	39	2480	4.00	3.60	0.01	0.01	1	-
BLE	0	Top (Applied Part)	0	2402	4.00	3.60	0.00	0.00	2	-
BLE	0	Top (Applied Part)	0	2402	4.00	3.60	0.00	0.00	3	-

**Note(s):**

1. Measurements with 'smart head #1'
2. Spot test worst Case measurements with 'smart head #2'
3. Spot test worst Case measurements with 'smart head #3'

### 10.1.5. Bluetooth 2.4GHz 1g – Body-Worn

Max Reported SAR = 0.01 (W/kg)

Mode	Dist. (mm)	EUT Position	Channel Number	Freq (MHz)	Power (dBm)		1g: SAR Results (W/kg)		Notes	Plot No.
					Tune Up Limit	Meas.	Meas. SAR Level	Reported SAR		
BLE	0	Top (Applied Part)	0	2402	4.00	3.60	0.01	0.01	1	-
BLE	0	Top (Applied Part)	19	2440	4.00	3.55	0.01	0.01	1	-
BLE	0	Top (Applied Part)	39	2480	4.00	3.60	0.01	0.01	1	-
BLE	0	Top (Applied Part)	0	2402	4.00	3.60	0.00	0.00	2	-
BLE	0	Top (Applied Part)	0	2402	4.00	3.60	0.00	0.00	3	-

**Note(s):**

1. Measurements with 'smart head #1'
2. Spot test worst Case measurements with 'smart head #2'
3. Spot test worst Case measurements with 'smart head #3'

### 10.1.6. Bluetooth 2.4GHz 10g – Extremity

Max Reported SAR = 0.09 (W/kg)

Mode	Dist. (mm)	EUT Position	Channel Number	Freq (MHz)	Power (dBm)		10g: SAR Results (W/kg)		Notes	Plot No.
					Tune Up Limit	Meas.	Meas. SAR Level	Reported SAR		
BLE	0	Front	0	2402	4.00	3.60	0.01	0.01	1	-
BLE	0	Back	0	2402	4.00	3.60	0.04	0.04	1	-
BLE	0	Left	0	2402	4.00	3.60	0.02	0.02	1	-
BLE	0	Right	0	2402	4.00	3.60	0.02	0.02	1	-
BLE	0	Top (Applied Part)	0	2402	4.00	3.60	0.01	0.01	1	-
BLE	0	Back@ Head	0	2402	4.00	3.60	0.06	0.07	1	-
BLE	0	Back@ Head	19	2440	4.00	3.55	0.08	0.09	1	002
BLE	0	Back@ Head	39	2480	4.00	3.60	0.07	0.08	1	-
BLE	0	Back@ Head	19	2440	4.00	3.55	0.08	0.09	2	-
BLE	0	Back@ Head	19	2440	4.00	3.55	0.08	0.09	3	-

**Note(s):**

1. Measurements with 'smart head #1'
2. Spot test worst Case measurements with 'smart head #2'
3. Spot test worst Case measurements with 'smart head #3'

## **10.2.SAR Measurement Variability**

In accordance with published RF Exposure KDB procedure 865664 D01 SAR measurement 100 MHz to 6 GHz. These additional measurements are repeated after the completion of all measurements requiring the same head or body tissue-equivalent medium in a frequency band. The test device should be returned to ambient conditions (normal room temperature) with the battery fully charged before it is re-mounted on the device holder for the repeated measurement(s) to minimize any unexpected variations in the repeated results.

### **1g-SAR (Head)**

- 1) Repeated measurement is not required when the original highest measured SAR is  $< 0.8$  W/Kg; steps 2) through 4) do not apply.
- 2) When the original highest measured 1g-SAR is  $\geq 0.80$  W/Kg, repeat that measurement once.
- 3) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is  $> 1.20$  or when the original or repeated measurement is  $\geq 1.45$  W/kg (~ 10% from the 1g-SAR limit).
- 4) Perform a third repeated measurement only if the original, first or second repeated measurement is  $\geq 1.50$  W/Kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is  $> 1.20$ .

Note: Since the 1g measured SAR for none of the runs was  $> 0.8$  W/Kg, repeat measurements were not performed on Extremity.

### **1g-SAR (Body-worn)**

- 5) Repeated measurement is not required when the original highest measured SAR is  $< 0.8$  W/Kg; steps 2) through 4) do not apply.
- 6) When the original highest measured 1g-SAR is  $\geq 0.80$  W/Kg, repeat that measurement once.
- 7) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is  $> 1.20$  or when the original or repeated measurement is  $\geq 1.45$  W/kg (~ 10% from the 1g-SAR limit).
- 8) Perform a third repeated measurement only if the original, first or second repeated measurement is  $\geq 1.50$  W/Kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is  $> 1.20$ .

Note: Since the 1g measured SAR for none of the runs was  $> 0.8$  W/Kg, repeat measurements were not performed on Extremity.

### **10g-SAR (Extremity)**

- 1) Repeated measurement is not required when the original highest measured SAR is  $< 2.0$  W/Kg; steps 2) through 4) do not apply.
- 2) When the original highest measured 10g-SAR is  $\geq 2.00$  W/Kg, repeat that measurement once.
- 3) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is  $> 1.20$  or when the original or repeated measurement is  $\geq 3.625$  W/kg (~ 10% from the 10g-SAR limit).
- 4) Perform a third repeated measurement only if the original, first or second repeated measurement is  $\geq 3.75$  W/Kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is  $> 1.20$ .

Note: Since the 10g measured SAR for none of the runs was  $> 2.0$  W/Kg, repeat measurements were not performed on Extremity.

## **11.Highest Standalone SAR and Simultaneous Transmission**

### **11.1.Highest Standalone Reported SAR**

#### **Individual Transmitter Evaluation per Band:**

<b>Exposure Configuration</b>	<b>Technology Band</b>	<b>Reported 1g - SAR (W/Kg)</b>	<b>Equipment Class</b>	<b>Highest Reported 1g -SAR (W/Kg)</b>
Head (Separation Distance 0mm)	WLAN 2.4 GHz	0.02	DTS	0.02
	Bluetooth (LE)	0.01	DTS	0..01

<b>Exposure Configuration</b>	<b>Technology Band</b>	<b>Reported 1g - SAR (W/Kg)</b>	<b>Equipment Class</b>	<b>Highest Reported 1g -SAR (W/Kg)</b>
Body-Worn (Separation Distance 0mm)	WLAN 2.4 GHz	0.02	DTS	0.02
	Bluetooth (LE)	0.01	DTS	0..01

<b>Exposure Configuration</b>	<b>Technology Band</b>	<b>Reported 10g - SAR (W/Kg)</b>	<b>Equipment Class</b>	<b>Highest Reported 10g -SAR (W/Kg)</b>
EXTREMITY (Separation Distance 0mm)	WLAN 2.4 GHz	1.05	DTS	1.05
	Bluetooth (LE)	0.09	DTS	0.09

## **11.2.Simultaneous Transmission analysis**

Simultaneous transmission SAR test exclusion is determined for each operating configuration and exposure condition according to the *reported* standalone SAR of each applicable simultaneous transmitting antenna. The worst-case simultaneous transmission analysis is considered for the following cases:

**Note:** No simultaneous transmission analysis is evaluated as this feature is not supported.
