SAR Evaluation Report 5 of 100

### **EUT DESCRIPTION**

This report has been prepared on behalf of DDM Brands LLC and their product, FCC ID: A4JANDYA6M , Model: Andy A6M or the EUT (Equipment under Test) as referred to in the rest of this report. The EUT is a 3G mobile phone.

Report No: RSZ140812003-20

\*Note: This series products model: Andy A6M, A6M, A6MJ186,A6MJ186BK, we select model: Andy A6M to test, there is no electrical change has been made to the equipment, please refer to the product similarity letter.

### **Technical Specification**

| Product Type              | Portable  |  |
|---------------------------|---|--|
| <b>Exposure Category:</b> | Population / Uncontrolled                             |  |
| Antenna Type(s):          | Internal Antenna                                      |  |
| Body-Worn Accessories:    | Headset   |  |
| Face-Head Accessories:    | None  |  |
| Multi-slot Class:         | Class12   |  |
| Operation Mode:           | GSM Voice, EGPRS/GPRS Data, WCDMA, WiFi and Bluetooth |  |
|                           | GSM 850 : 824-849 MHz(TX) ; 869-894 MHz(RX)           |  |

| Engage and Dands          | WCDMA850: 824-849 MHz(TX) ; 869-894 MHz(RX)           |  |
| Frequency Band:           | WCDMA1900: 1850-1910 MHz(TX) ; 1930-1990 MHz(RX)      |  |
|                           | WiFi: 2412MHz-2462MHz                                 |  |
|                           | Bluetooth: 2402MHz-2480MHz                            |  |
|                           | GSM 850 : 31.67 dBm                                   |  |
|                           | PCS 1900: 28.32 dBm                                   |  |
| Conducted RF Power:       | WCDMA 850: 22.14 dBm                                  |  |
| Conducted RF Power:       | WCDMA 1900: 22.79 dBm                                 |  |
|                           | WiFi: 9.36 dBm  |  |
|                           | Bluetooth: 5.18dBm                                    |  |
| Dimensions (L*W*H):       | 170 mm (L) × 86 mm (W) × 9 mm (H)                     |  |
| Power Source:             | 3.7 V <sub>DC</sub> Rechargeable Battery              |  |
| Normal Operation:         | Head and Body-worn                                    |  |

SAR Evaluation Report 6 of 100

### REFERENCE, STANDARDS, AND GUILDELINES

### FCC:

The Report and Order requires routine SAR evaluation prior to equipment authorization of portable transmitter devices, including portable telephones. For consumer products, the applicable limit is 1.6 mW/g as recommended by the ANSI/IEEE standard C95.1-1992 [6] for an uncontrolled environment (Paragraph 65). According to the Supplement C of OET Bulletin 65 "Evaluating Compliance with FCC Guide-lines for Human Exposure to Radio frequency Electromagnetic Fields", released on Jun 29, 2001 by the FCC, the device should be evaluated at maximum output power (radiated from the antenna) under "worst-case" conditions for normal or intended use, incorporating normal antenna operating positions, device peak performance frequencies and positions for maximum RF energy coupling.

Report No: RSZ140812003-20

This report describes the methodology and results of experiments performed on wireless data terminal. The objective was to determine if there is RF radiation and if radiation is found, what is the extent of radiation with respect to safety limits. SAR (Specific Absorption Rate) is the measure of RF exposure determined by the amount of RF energy absorbed by human body (or its parts) – to determine how the RF energy couples to the body or head which is a primary health concern for body worn devices. The limit below which the exposure to RF is considered safe by regulatory bodies in North America is 1.6 mW/g average over 1 gram of tissue mass.

### CE:

The order requires routine SAR evaluation prior to equipment authorization of portable transmitter devices, including portable telephones. For consumer products, the applicable limit is 2 mW/g as recommended by EN62209-1 for an uncontrolled environment. According to the Standard, the device should be evaluated at maximum output power (radiated from the antenna) under "worst-case" conditions for normal or intended use, incorporating normal antenna operating positions, device peak performance frequencies and positions for maximum RF energy coupling.

This report describes the methodology and results of experiments performed on wireless data terminal. The objective was to determine if there is RF radiation and if radiation is found, what is the extent of radiation with respect to safety limits. SAR (Specific Absorption Rate) is the measure of RF exposure determined by the amount of RF energy absorbed by human body (or its parts) – to determine how the RF energy couples to the body or head which is a primary health concern for body worn devices. The limit below which the exposure to RF is considered safe by regulatory bodies in Europe is 2 mW/g average over 10 gram of tissue mass.

The test configurations were laid out on a specially designed test fixture to ensure the reproducibility of measurements. Each configuration was scanned for SAR. Analysis of each scan was carried out to characterize the above effects in the device.

SAR Evaluation Report 7 of 100

### **SAR Limits**

### FCC Limit (1g Tissue)

Report No: RSZ140812003-20

|  | SAR (W/kg)   |  |  |  |
|--|--|--|--|--|
| EXPOSURE LIMITS  | (General Population /<br>Uncontrolled Exposure<br>Environment) | (Occupational /<br>Controlled Exposure<br>Environment) |  |  |
| Spatial Average (averaged over the whole body)                   | 0.08   | 0.4  |  |  |
| Spatial Peak<br>(averaged over any 1 g of tissue)                | 1.60   | 8.0  |  |  |
| Spatial Peak<br>(hands/wrists/feet/ankles<br>averaged over 10 g) | 4.0  | 20.0   |  |  |

### CE Limit (10g Tissue)

|  | SAR (W/kg)   |  |  |  |  |
|--|--|--|--|--|--|
| EXPOSURE LIMITS  | (General Population /<br>Uncontrolled Exposure<br>Environment) | (Occupational /<br>Controlled Exposure<br>Environment) |  |  |  |
| Spatial Average (averaged over the whole body)             | 0.08   | 0.4  |  |  |  |
| Spatial Peak (averaged over any 10 g of tissue)            | 2.0  | 10   |  |  |  |
| Spatial Peak (hands/wrists/feet/ankles averaged over 10 g) | 4.0  | 20.0   |  |  |  |

Population/Uncontrolled Environments are defined as locations where there is the exposure of individual who have no knowledge or control of their exposure.

Occupational/Controlled Environments are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure (i.e. as a result of employment or occupation).

General Population/Uncontrolled environments Spatial Peak limit 1.6W/kg (FCC) & 2 W/kg (CE) applied to the EUT.

SAR Evaluation Report 8 of 100

### **FACILITIES**

The test site used by Bay Area Compliance Laboratories Corp. (Shenzhen) to collect data is located at 6/F, the 3rd Phase of WanLi Industrial Building, Shi Hua Road, Fu Tian Free Trade Zone, Shenzhen, Guangdong, P.R. of China

Report No: RSZ140812003-20

SAR Evaluation Report 9 of 100

### **DESCRIPTION OF TEST SYSTEM**

These measurements were performed with ALSAS 10 Universal Integrated SAR Measurement system from APREL Laboratories.

### **ALSAS-10U System Description**

ALSAS-10-U is fully compliant with the technical and scientific requirements of IEEE 1528, IEC 62209, CENELEC, ARIB, ACA, and the Federal Communications Commission. The system comprises of a six axes articulated robot which utilizes a dedicated controller. ALSAS-10U uses the latest methodologies. And FDTD modeling to provide a platform which is repeatable with minimum uncertainty.

### **Applications**

Predefined measurement procedures compliant with the guidelines of CENELEC, IEEE, IEC, FCC, etc are utilized during the assessment for the device. Automatic detection for all SAR maxima are embedded within the core architecture for the system, ensuring that peak locations used for centering the zoom scan are within a 1mm resolution and a 0.05mm repeatable position. System operation range currently available up-to 6 GHz in simulated tissue.

### **Area Scans**

Area scans are defined prior to the measurement process being executed with a user defined variable spacing between each measurement point (integral) allowing low uncertainty measurements to be conducted. Scans defined for FCC applications utilize a 10mm2 step integral, with 1mm interpolation used to locate the peak SAR area used for zoom scan assessments.

Where the system identifies multiple SAR peaks (which are within 25% of peak value) the system will provide the user with the option of assessing each peak location individually for zoom scan averaging.

### **Zoom Scan (Cube Scan Averaging)**

The averaging zoom scan volume utilized in the ALSAS-10U software is in the shape of a cube and the side dimension of a 1 g or 10 g mass is dependent on the density of the liquid representing the simulated tissue. A density of 1000 kg/m3 is used to represent the head and body tissue density and not the phantom liquid density, in order to be consistent with the definition of the liquid dielectric properties, i.e. the side length of the 1 g cube is 10mm, with the side length of the 10 g cube 21,5mm.

When the cube intersects with the surface of the phantom, it is oriented so that 3 vertices touch the surface of the shell or the center of a face is tangent to the surface. The face of the cube closest to the surface is modified in order to conform to the tangent surface.

The zoom scan integer steps can be user defined so as to reduce uncertainty, but normal practice for typical test applications (including FCC) utilize a physical step of 5x5x8 (8mmx8mmx5mm) providing a volume of 32mm in the X & Y axis, and 35mm in the Z axis.

SAR Evaluation Report 10 of 100

### **ALSAS-10U Interpolation and Extrapolation Uncertainty**

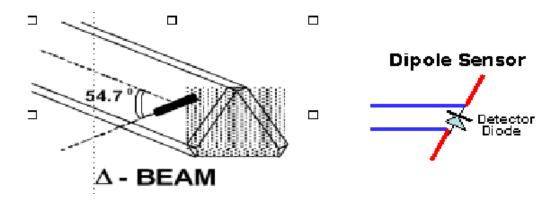

The overall uncertainty for the methodology and algorithms the used during the SAR calculation was evaluated using the data from IEEE 1528 based on the example f3 algorithm:

$$f_3(x, y, z) = A \frac{a^2}{\frac{a^2}{4} + x'^2 + y'^2} \cdot \left( e^{-\frac{2z}{a}} + \frac{a^2}{2(a+2z)^2} \right)$$

### **Isotropic E-Field Probe**

The isotropic E-Field probe has been fully calibrated and assessed for isotropicity, and boundary effect within a controlled environment. Depending on the frequency for which the probe is calibrated the method utilized for calibration will change.

The E-Field probe utilizes a triangular sensor arrangement as detailed in the diagram below:

SAR is assessed with a calibrated probe which moves at a default height of 5mm from the center of the diode, which is mounted to the sensor, to the phantom surface (in the Z Axis). The 5mm offset height has been selected so as to minimize any resultant boundary effect due to the probe being in close proximity to the phantom surface.

The following algorithm is an example of the function used by the system for linearization of the output from the probe when measuring complex modulation schemes.

$$V_i = U_i + U_i^2 \cdot \frac{cf}{dcp_i}$$

SAR Evaluation Report 11 of 100

### **Isotropic E-Field Probe Specification**

| Calibration Method  | Frequency Dependent Below 1 GHz Calibration in air performed in a TEM Cell                                   |  |  |  |
|---|--|--|--|--|
| Canbration Method   | Above 1 GHz Calibration in air performed in a TEM Cell Above 1 GHz Calibration in air performed in waveguide |  |  |  |
| Sensitivity   | $0.70 \ \mu V/(V/m)^2$ to $0.85 \ \mu V/(V/m)^2$   |  |  |  |
| Dynamic Range   | 0.0005 W/kg to 100 W/kg  |  |  |  |
| Isotropic Response  | Better than 0.1 dB   |  |  |  |
| Diode Compression Point<br>(DCP)  | Calibration for Specific Frequency   |  |  |  |
| Probe Tip Diameter  | < 2.9 mm   |  |  |  |
| <b>Sensor Offset</b> 1.56 (+/- 0.02 mm)                                 |  |  |  |  |
| Probe Length  | 289 mm   |  |  |  |
| Video Bandwidth   | @ 500 Hz: 1 dB<br>@ 1.02 kHz: 3 dB   |  |  |  |
| <b>Boundary Effect</b> Less than 2.1% for distance greater than 0.58 mm |  |  |  |  |
|   | The spatial resolution uncertainty is less than 1.5% for 4.9mm diameter probe.                               |  |  |  |
| Spatial Resolution  | The spatial resolution uncertainty is less than 1.0% for 2.5mm diameter probe                                |  |  |  |

Report No: RSZ140812003-20

### **Boundary Detection Unit and Probe Mounting Device**

ALSAS-10U incorporates a boundary detection unit with a sensitivity of 0.05mm for detecting all types of surfaces. The robust design allows for detection during probe tilt (probe normalize) exercises, and utilizes a second stage emergency stop. The signal electronics are fed directly into the robot controller for high accuracy surface detection in lateral and axial detection modes (X, Y, & Z).

The probe is mounted directly onto the Boundary Detection unit for accurate tooling and displacement calculations controlled by the robot kinematics. The probe is connect to an isolated probe interconnect where the output stage of the probe is fed directly into the amplifier stage of the Daq-Paq.

### **Daq-Paq (Analog to Digital Electronics)**

ALSAS-10U incorporates a fully calibrated Daq-Paq (analog to digital conversion system) which has a 4 channel input stage, sent via a 2 stage auto-set amplifier module. The input signal is amplified accordingly so as to offer a dynamic range from  $5\mu V$  to 800mV. Integration of the fields measured is carried out at board level utilizing a Co-Processor which then sends the measured fields down into the main computational module in digitized form via an RS232 communications port. Probe linearity and duty cycle compensation is carried out within the main Daq-Paq module.

| ADC   | 12 Bit  |  |
|---|---|--|
| Amplifier Range 20 mV to 200 mV and 150 mV to 800 mV        |   |  |
| Field Integration   | Local Co-Processor utilizing proprietary integration algorithms |  |
| Number of Input Channels 4 in total 3 dedicated and 1 spare |   |  |
| Communication   | Packet data via RS232   |  |

SAR Evaluation Report 12 of 100

#### **Axis Articulated Robot**

ALSAS-10U utilizes a six axis articulated robot, which is controlled using a Pentium based real-time movement controller. The movement kinematics engine utilizes proprietary (Thermo CRS) interpolation and extrapolation algorithms, which allow full freedom of movement for each of the six joints within the working envelope. Utilization of joint 6 allows for full probe rotation with a tolerance better than 0.05mm around the central axis.

Report No: RSZ140812003-20

| Robot/Controller Manufacturer | Thermo CRS                        |  |  |
|-------------------------------|-----------------------------------|--|--|
| Number of Axis                | Six independently controlled axis |  |  |
| Positioning Repeatability     | 0.05 mm                           |  |  |
| Controller Type               | Single phase Pentium based C500C  |  |  |
| Robot Reach                   | 710 mm                            |  |  |
| Communication                 | RS232 and LAN compatible          |  |  |

### **ALSAS Universal Workstation**

ALSAS Universal workstation allows for repeatability and fast adaptability. It allows users to do calibration, testing and measurements using different types of phantoms with one set up, which significantly speeds up the measurement process.

### **Universal Device Positioner**

The universal device positioner allows complete freedom of movement of the EUT. Developed to hold a EUT in a free-space scenario any additional loading attributable to the material used in the construction of the positioner has been eliminated. Repeatability has been enhanced through the linear scales which form the design used to indicate positioning for any given test scenario in all major axes. A 15° tilt indicator is included for the of aid cheek to tilt movements for head SAR analysis. Overall uncertainty for measurements have been reduced due to the design of the Universal device positioner, which allows positioning of a device in as near to a free-space scenario as possible, and by providing the means for complete repeatability.

SAR Evaluation Report 13 of 100

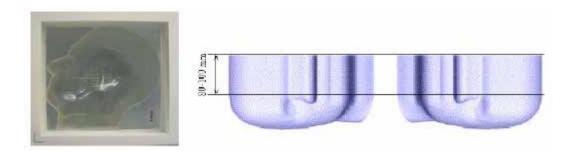

Report No: RSZ140812003-20

### **Phantom Types**

The ALSAS-10U allows the integration of multiple phantom types. SAM Phantoms fully compliant with IEEE 1528, Universal Phantom, and Universal Flat.

### **APREL SAM Phantoms**

The SAM phantoms developed using the IEEE SAM CAD file. They are fully compliant with the requirements for both IEEE 1528 and FCC Supplement C. Both the left and right SAM phantoms are interchangeable, transparent and include the IEEE 1528 grid with visible NF and MB lines.

SAR Evaluation Report 14 of 100

### **APREL Laboratories Universal Phantom**

The Universal Phantom is used on the ALSAS-10U as a system validation phantom. The Universal Phantom has been fully validated both experimentally from 800MHz to 6GHz and numerically using XFDTD numerical software.

Report No: RSZ140812003-20

The shell thickness is 2mm overall, with a 4mm spacer located at the NF/MB intersection providing an overall thickness of 6mm in line with the requirements of IEEE-1528.

The design allows for fast and accurate measurements, of handsets, by allowing the conservative SAR to be evaluated at on frequency for both left and right head experiments in one measurement.

SAR Evaluation Report 15 of 100

### **Tissue Dielectric Parameters for Head and Body Phantoms**

The head tissue dielectric parameters recommended by the IEEE SCC-34/SC-2 in P1528 have been incorporated in the following table. These head parameters are derived from planar layer models simulating the highest expected SAR for the dielectric properties and tissue thickness variations in a human head. Other head and body tissue parameters that have not been specified in P1528 are derived from the tissue dielectric parameters computed from the 4-Cole-Cole equations described in Reference [12] and extrapolated according to the head parameters specified in P1528.

### **EUT TEST STRATEGY AND METHODOLOGY**

### Test Positions for Device Operating Next to a Person's Ear

This category includes most wireless handsets with fixed, retractable or internal antennas located toward the top half of the device, with or without a foldout, sliding or similar keypad cover. The handset should have its earpiece located within the upper ¼ of the device, either along the centerline or off-centered, as perceived by its users. This type of handset should be positioned in a normal operating position with the "test device reference point" located along the "vertical centerline" on the front of the device aligned to the "ear reference point". The "test device reference point" should be located at the same level as the center of the earpiece region. The "vertical centerline" should bisect the front surface of the handset at its top and bottom edges. A "ear reference point" is located on the outer surface of the head phantom on each ear spacer. It is located 1.5 cm above the center of the ear canal entrance in the "phantom reference plane" defined by the three lines joining the center of each "ear reference point" (left and right) and the tip of the mouth.

A handset should be initially positioned with the earpiece region pressed against the ear spacer of a head phantom. For the SCC-34/SC-2 head phantom, the device should be positioned parallel to the "N-F" line defined along the base of the ear spacer that contains the "ear reference point". For interim head phantoms, the device should be positioned parallel to the cheek for maximum RF energy coupling. The "test device reference point" is aligned to the "ear reference point" on the head phantom and the "vertical centerline" is aligned to the "phantom reference plane". This is called the "initial ear position". While maintaining these three alignments, the body of the handset is gradually adjusted to each of the following positions for evaluating SAR:

SAR Evaluation Report 30 of 100

#### **Cheek/Touch Position**

The device is brought toward the mouth of the head phantom by pivoting against the "ear reference point" or along the "N-F" line for the SCC-34/SC-2 head phantom.

This test position is established:

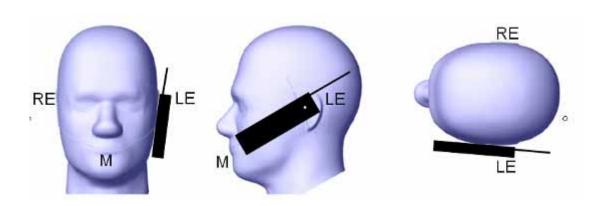

• When any point on the display, keypad or mouthpiece portions of the handset is in contact with the phantom.

Report No: RSZ140812003-20

o (or) When any portion of a foldout, sliding or similar keypad cover opened to its intended self-adjusting normal use position is in contact with the cheek or mouth of the phantom.

For existing head phantoms – when the handset loses contact with the phantom at the pivoting point, rotation should continue until the device touches the cheek of the phantom or breaks its last contact from the ear spacer.

### **Cheek / Touch Position**

### **Ear/Tilt Position**

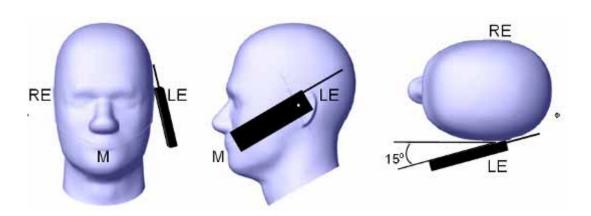

With the handset aligned in the "Cheek/Touch Position":

- 1) If the earpiece of the handset is not in full contact with the phantom's ear spacer (in the "Cheek/Touch position") and the peak SAR location for the "Cheek/Touch" position is located at the ear spacer region or corresponds to the earpiece region of the handset, the device should be returned to the "initial ear position" by rotating it away from the mouth until the earpiece is in full contact with the ear spacer.
- 2) (otherwise) The handset should be moved (translated) away from the cheek perpendicular to the line passes through both "ear reference points" (note: one of these ear reference points may not physically exist on a split head model) for approximate 2-3 cm. While it is in this position, the device handset is tilted away from the mouth with respect to the "test device reference point" until the inside angle between the vertical centerline on the front surface of the phone and the horizontal line passing through the ear reference point isby 15 80°. After the tilt, it is then moved (translated) back toward the head perpendicular to the line passes through both "ear reference points" until the device touches the phantom or the ear spacer. If the antenna touches the head first, the positioning process should be repeated with a tilt angle less than 15° so that the device and its antenna would touch the phantom simultaneously. This test position may require a device holder or positioner to achieve the translation and tilting with acceptable positioning repeatability.

SAR Evaluation Report 31 of 100

If a device is also designed to transmit with its keypad cover closed for operating in the head position, such positions should also be considered in the SAR evaluation. The device should be tested on the left and right side of the head phantom in the "Cheek/Touch" and "Ear/Tilt" positions. When applicable, each configuration should be tested with the antenna in its fully extended and fully retracted positions. These test configurations should be tested at the high, middle and low frequency channels of each operating mode; for example, AMPS, CDMA, and TDMA. If the SAR measured at the middle channel for each test configuration (left, right, Cheek/Touch, Tile/Ear, extended and retracted) is at least 2.0 dB lower than the SAR limit, testing at the high and low channels is optional for such test configuration(s). If the transmission band of the test device is less than 10 MHz, testing at the high and low frequency channels is optional.

### Ear /Tilt 15° Position

### Test positions for body-worn and other configurations

Body-worn operating configurations should be tested with the belt-clips and holsters attached to the device and positioned against a flat phantom in normal use configurations. Devices with a headset output should be tested with a headset connected to the device. When multiple accessories that do not contain metallic components are supplied with the device, the device may be tested with only the accessory that dictates the closest spacing to the body. When multiple accessories that contain metallic components are supplied with the device, the device must be tested with each accessory that contains a unique metallic component. If multiple accessories share an identical metallic component (e.g., the same metallic belt-clip used with different holsters with no other metallic components), only the accessory that dictates the closest spacing to the body must be tested.

Body-worn accessories may not always be supplied or available as options for some devices that are intended to be authorized for body-worn use. A separation distance of 1.5 cm between the back of the device and a flat phantom is recommended for testing body-worn SAR compliance under such circumstances. Other separation distances may be used, but they should not exceed 2.5 cm. In these cases, the device may use body-worn accessories that provide a separation distance greater than that tested for the device provided however that the accessory contains no metallic components.

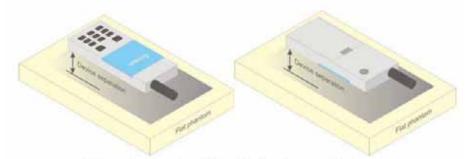

Figure 5 - Test positions for body-worn devices

SAR Evaluation Report 32 of 100

#### **SAR Evaluation Procedure**

The evaluation was performed with the following procedure:

Step 1: Measurement of the SAR value at a fixed location above the ear point or central position was used as a reference value for assessing the power drop. The SAR at this point is measured at the start of the test and then again at the end of the testing.

Report No: RSZ140812003-20

- Step 2: The SAR distribution at the exposed side of the head was measured at a distance of 4 mm from the inner surface of the shell. The area covered the entire dimension of the head or EUT and the horizontal grid spacing was 10 mm x 10 mm. Based on these data, the area of the maximum absorption was determined by spline interpolation. The first Area Scan covers the entire dimension of the EUT to ensure that the hotspot was correctly identified.
- Step 3: Around this point, a volume of 35 mm x 35 mm x 35 mm was assessed by measuring 7x 7 x 7 points. On the basis of this data set, the spatial peak SAR value was evaluated under the following procedure:
  - 1) The data at the surface were extrapolated, since the center of the dipoles is 1.2 mm away from the tip of the probe and the distance between the surface and the lowest measuring point is 1.3 mm. The extrapolation was based on a least square algorithm. A polynomial of the fourth order was calculated through the points in z-axes. This polynomial was then used to evaluate the points between the surface and the probe tip.
  - 2) The maximum interpolated value was searched with a straightforward algorithm. Around this maximum the SAR values averaged over the spatial volumes (1 g or 10 g) were computed by the 3D-Spline interpolation algorithm. The 3D-Spline is composed of three one dimensional splines with the "Not a knot"-condition (in x, y and z-directions). The volume was integrated with the trapezoidal-algorithm. One thousand points (10 x 10 x 10) were interpolated to calculate the averages.

All neighboring volumes were evaluated until no neighboring volume with a higher average value was found.

Step 4: Re-measurement of the SAR value at the same location as in Step 1. If the value changed by more than 5%, the evaluation was repeated.

### CONDUCTED OUTPUT POWER MEASUREMENT

### **Provision Applicable**

The measured peak output power should be greater and within 5% than EMI measurement.

### **Test Procedure**

The RF output of the transmitter was connected to the input of the EMI Test Receiver through sufficient attenuation.

Report No: RSZ140812003-20

### **GPRS**:

| Band     | Channel | Channel Frequency |        | RF Output Power (dBm) |         |         |  |  |
|----------|---------|-------------------|--------|-----------------------|---------|---------|--|--|
| Danu     | No.     | (MHz)             | 1 slot | 2 slot                | 3 slots | 4 slots |  |  |
|          | 128     | 824.2             | 31.71  | 31.10                 | 29.57   | 28.78   |  |  |
| GSM 850  | 190     | 836.6             | 31.62  | 31.02                 | 29.53   | 28.74   |  |  |
|          | 251     | 848.8             | 31.70  | 31.06                 | 29.63   | 28.83   |  |  |
|          | 512     | 1850.2            | 28.37  | 27.62                 | 25.83   | 24.90   |  |  |
| PCS 1900 | 661     | 1880.0            | 28.28  | 27.57                 | 25.91   | 25.05   |  |  |
|          | 810     | 1909.8            | 28.34  | 27.71                 | 26.16   | 25.28   |  |  |

For SAR, the time based average power is relevant, the difference in between depends on the duty cycle of the TDMA signal.

| Number of Time slot                                  | 1     | 2     | 3        | 4     |
|--|-------|-------|----------|-------|
| Duty Cycle   | 1:8   | 1:4   | 1:2.66   | 1:2   |
| Time based Ave. power compared to slotted Ave. power | -9 dB | -6 dB | -4.25 dB | -3 dB |
| Crest Factor   | 8     | 4     | 2.66     | 2     |

### The time based average power for GPRS

| Dand     | Channel | Frequency | Time   | e based avera | ge Power (dB | Sm)     |
|----------|---------|-----------|--------|---------------|--------------|---------|
| Band     | No.     | (MHz)     | 1 slot | 2 slot        | 3 slots      | 4 slots |
|          | 128     | 824.2     | 22.71  | 25.10         | 25.32        | 25.78   |
| GSM 850  | 190     | 836.6     | 22.62  | 25.02         | 25.28        | 25.74   |
|          | 251     | 848.8     | 22.70  | 25.06         | 25.38        | 25.83   |
|          | 512     | 1850.2    | 19.37  | 21.62         | 21.58        | 21.90   |
| PCS 1900 | 661     | 1880.0    | 19.28  | 21.57         | 21.66        | 22.05   |
|          | 810     | 1909.8    | 19.34  | 21.71         | 21.91        | 22.28   |

SAR Evaluation Report 35 of 100

#### Note:

1. Rohde & Schwarz Radio Communication Tester (CMU200) was used for the measurement of GSM peak and average output power for active timeslots.
For GSM voice, 1 timeslot has been activated with power level 5 (850 MHz band) and 0 (1900 MHz

Report No: RSZ140812003-20

- 3. For GPRS, 1, 2, 3 and 4 timeslots has been activated separately with power level 3(850 MHz band) and 3(1900 MHz band).
- 4. For EGPRS mode, only downlink is supported.

#### **WCDMA-Release 99:**

The following tests were conducted according to the test requirements outlines in section 5.2 of the 3GPP TS34.121-1 specification. The EUT has a nominal maximum output power of 24dBm (+1.7/-3.7).

|                     | Loopback Mode              | Test Mode 1  |
|---------------------|----------------------------|--------------|
| WCDMA               | Rel99 RMC                  | 12.2kbps RMC |

#### Note:

- 1. The default test configuration is to measure SAR with an established radio link between the EUT and a communication test set using a 12.2 kbps RMC (reference measurement Channel) Configured in Test Loop Model 1.
- KDB 941225 D01-Body SAR is not required for HSDPA when the maximum average output of each RF channel with HSDPA active is less than ¼ dB higher than measured without HSDPA using 12.2kbps RMC or the maximum SAR for 12.2kbps RMC is < 75% of SAR limit.</li>
   KDB 941225 D01-Body SAR is not required for HSUPA when the maximum average output of each RF
- 3. KDB 941225 D01-Body SAR is not required for HSUPA when the maximum average output of each RF channel with HSUPA active is less than ¼ dB higher than measured without HSUPA using 12.2kbps RMC and the maximum SAR for 12.2kbps RMC is < 75% of SAR limit.

#### Note:

40 of 100 SAR Evaluation Report

When the 1-g SAR is ≤ 0.8W/Kg, testing for other channels are optional.
 The EUT transmit and receive through the same GSM antenna while testing SAR.
 When SAR or MPE is not measured at the maximum power level allowed for production units, the results must be scaled to the maximum tune-up tolerance limit according to the power applied to the individual channels tested to determine compliance.

Report No: RSZ140812003-20

- Note:

   When the 1-g SAR is ≤ 0.8W/Kg, testing for other channels are optional.
   The EUT transmit and receive through the same GSM antenna while testing SAR.
   When SAR or MPE is not measured at the maximum power level allowed for production units, the results must be scaled to the maximum tune-up tolerance limit according to the power applied to the individual channels tested to determine compliance.

   When the maximum output power variation across the required test channels is > ½ dB, instead of the middle channel, the highest output power channel must be used.

#### Note:

- 1. When the 1-g SAR is  $\leq$  0.8W/Kg, testing for other channels are optional.
- 2. The default test configuration is to measure SAR with an established radio link between the EUT and a communication test set using a 12.2 kbps RMC (reference measurement Channel) Configured in Test Loop Model.
- 5. When SAR or MPE is not measured at the maximum power level allowed for production units, the results must be scaled to the maximum tune-up tolerance limit according to the power applied to the individual channels tested to determine compliance.

SAR Evaluation Report 42 of 100

The DUT is capable of functioning as a WiFi to Cellular Mobile hotspot. Additional SAR testing was performed according to KDB 941225 D06. Testing was performed with a separation of 1cm between the DUT and the flat phantom. The DUT was positioned for SAR tests with the front and back surfaces facing the phantom, and also with the edges facing the phantom in which the transmitting antenna is <2.5 cm from the edge. Each transmit band was utilized for SAR testing. The tested mode has been selected within each band that exhibits the highest time average output power.

#### **Note:**

- 1. When the 1-g SAR is  $\leq$  0.8W/Kg, testing for other channels are optional.
- 2. The default test configuration is to measure SAR with an established radio link between the EUT and a communication test set using a 12.2 kbps RMC (reference measurement Channel) Configured in Test Loop Model.
- 5. When SAR or MPE is not measured at the maximum power level allowed for production units, the results must be scaled to the maximum tune-up tolerance limit according to the power applied to the individual channels tested to determine compliance.

Report No: RSZ140812003-20

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at *test separation distances*  $\leq$  50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)]  $\cdot [\sqrt{f(GHz)}] \le 3.0$  for 1-g SAR and  $\le 7.5$  for 10-g extremity SAR, where

- 1. f(GHz) is the RF channel transmit frequency in GHz.
- 2. Power and distance are rounded to the nearest mW and mm before calculation.
- 3. The result is rounded to one decimal place for comparison.
- 4. When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test Exclusion.

#### **Standalone SAR estimation:**

| Mode      | Frequency<br>(GHz) | Distance<br>(mm) | P <sub>avg</sub> (dBm) | P <sub>avg</sub> (mW) | Estimated 1-g (W/kg) |
|-----------|--------------------|------------------|------------------------|-----------------------|----------------------|
| BT Head   | 2.45               | 0                | 5.20                   | 3.31                  | 0.136                |
| BT Body   | 2.45               | 10               | 5.20                   | 3.31                  | 0.068                |
| Wifi Head | 2.45               | 0                | 9.40                   | 8.71                  | 0.364                |
| Wifi Body | 2.45               | 10               | 9.40                   | 8.71                  | 0.182                |

When standalone SAR test exclusion applies to an antenna that transmits simultaneously with other antennas, the standalone SAR must be estimated according to following to determine simultaneous transmission SAR test exclusion:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance,mm)]·[ $\sqrt{f(GHz)/x}$ ] W/kg for test separation distances  $\leq$  50 mm;

where x = 7.5 for 1-g SAR.

When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test Exclusion

Report No: RSZ140812003-20

#### **Conclusion:**

**ΣSAR < 1.6 W/kg** therefore simultaneous transmission SAR with Volume Scans is **not** required.

# Note:

If the sum of the 1g SAR measured for the simultaneously transmitting antennas is less than the SAR limit, SAR measurement for simultaneous transmission is not required.

# APPENDIX B – PROBE CALIBRATION CERTIFICATES

### NCL CALIBRATION LABORATORIES

Report No: RSZ140812003-20

Calibration File No.: PC-1537

Task No: BACL-5745

# CERTIFICATE OF CALIBRATION

It is certified that the equipment identified below has been calibrated in the NCL CALIBRATION LABORATORIES by qualified personnel following recognized procedures and using transfer standards traceable to NRC/NIST.

> Equipment: Miniature Isotropic RF Probe Record of Calibration Head and Body Manufacturer: APREL Laboratories Model No.: E-020 Serial No.: 500-00283

Calibration Procedure: D01-032-E020-V2, D22-012-Tissue, D28-002-Dipole Project No: BACL-5745

Calibrated: 8<sup>th</sup> October 2013 Released on: 8<sup>th</sup> October 2013

This Calibration Certificate is Incomplete Unless Accompanied with the Calibration Results Summary

SAR Evaluation Report 59 of 100

Division of APREL Inc.

#### Introduction

This Calibration Report reproduces the results of the calibration performed in line with the references listed below. Calibration is performed using accepted methodologies as per the references listed below. Probes are calibrated for air, and tissue and the values reported are the results from the physical quantification of the probe through meteorgical practices.

Report No: RSZ140812003-20

#### **Calibration Method**

Probes are calibrated using the following methods.

#### <1000MHz

TEM Cell for sensitivity in air

Standard phantom using temperature transfer method for sensitivity in tissue

#### >1000MHz

Waveguide\* method to determine sensitivity in air and tissue

"Waveguide is numerically (simulation) assessed to determine the field distribution and power

The boundary effect for the probe is assessed using a standard flat phantom where the probe output is compared against a numerically simulated series of data points

Division of APREL Inc.

#### Conditions

Probe 500-00283 was a recalibration.

Ambient Temperature of the Laboratory: 22 °C +/- 1.5 °C Temperature of the Tissue: 21 °C +/- 1.5 °C Relative Humidity: <60%

#### **Primary Measurement Standards**

#### Secondary Measurement Standards

Network Analyzer Anritsu 37347C 002106 Feb. 20, 2015

#### Attestation

The below named signatories have conducted the calibration and review of the data which is presented in this calibration report.

We the undersigned attest that to the best of our knowledge the calibration of this subject has been accurately conducted and that all information contained within the results pages have been reviewed for accuracy.

Art Brennan, Quality Manager

Dan Brooks, Test Engineer

**Probe Summary** 

Probe Type: E-Field Probe E020

Serial Number: 500-00283

Frequency: As presented on page 5

Report No: RSZ140812003-20

 Sensor Offset:
 1.56

 Sensor Length:
 2.5

Tip Enclosure: Composite\*

Tip Diameter: < 2.9 mm

Tip Length: 55 mm

Total Length: 289 mm

\*Resistive to recommended tissue recipes per IEEE-1528

Sensitivity in Air

Diode Compression Point: 95 mV

Division of APREL Inc.

#### **Boundary Effect:**

Uncertainty resulting from the boundary effect is less than 2.1% for the distance between the tip of the probe and the tissue boundary, when less than 0.58mm.

Report No: RSZ140812003-20

#### Spatial Resolution:

The spatial resolution uncertainty is less than 1.5% for 4.9mm diameter probe. The spatial resolution uncertainty is less than 1.0% for 2.5mm diameter probe.

#### **DAQ-PAQ Contribution**

To minimize the uncertainty calculation all tissue sensitivity values were calculated using a load impedance of  $5\,\mathrm{M}\Omega$ .

71 of 100 SAR Evaluation Report

3

Report No: RSZ140812003-20

Division of APREL Laboratories.

#### Introduction

This Calibration Report has been produced in line with the SSI Dipole Calibration Procedure SSI-TP-018-ALSAS. The results contained within this report are for Validation Dipole 180-00558. The calibration routine consisted of a three-step process. Step 1 was a mechanical verification of the dipole to ensure that it meets the mechanical specifications. Step 2 was an Electrical Calibration for the Validation Dipole, where the SWR, Impedance, and the Return loss were assessed. Step 3 involved a System Validation using the ALSAS-10U, along with APREL E-020 130 MHz to 26 GHz E-Field Probe Serial Number 212.

#### Conditions

Dipole 180-00558 was new taken from stock.

Ambient Temperature of the Laboratory: 22 °C +/- 0.5 °C Temperature of the Tissue: 20 °C +/- 0.5 °C

#### Dipole Calibration uncertainty

The calibration uncertainty for the dipole is made up of various parameters presented below.

 Mechanical
 1%

 Positioning Error
 1.22%

 Electrical
 1.7%

 Tissue
 2.2%

 Dipole Validation
 2.2%

TOTAL 8.32% (16.64% K=2)

#### Tissue Validation

|                     | Dielectric constant, ε <sub>r</sub> | Conductivity, o [S/m] |
|---------------------|-------------------------------------|-----------------------|
| Head Tissue 1900MHz | 38.4                                | 1.43                  |
| Body Tissue 1900MHz | 51.87                               | 1.59                  |

## 1900MHz Dipole Calibration By BACL at 2013-12-20

## **Mechanical Verification**

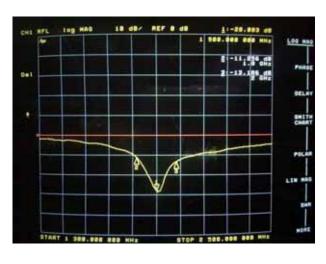

| APREL Length | APREL Height | Measured Length | Measured Height |
|--------------|--------------|-----------------|-----------------|
| 68.0 mm      | 39.4 mm      | 68.3 mm         | 39.2 mm         |

| Tissue Type | Measured Return Loss | Measured Impedance |
|-------------|----------------------|--------------------|
| Head        | -28.083 dB           | $47.477~\Omega$    |
| Body        | -22.022 dB           | $48.076~\Omega$    |

## APPENDIX F – DECLARATION LETTERS

DDM Brands LLC 1616 NW, 84TH Ave. Miami, Florida, U.S.A Tel: +13057750325 Fax: +13057750325

Report No: RSZ140812003-20

8/20/2014

#### **Product Similarity Declaration**

To Whom It May Concern,

We, <u>DDM Brands LLC</u>, hereby declare that we have a product named as <u>3G mobile phone (Model number: Andy A6M)</u> was tested by BACL, meanwhile, for our marketing purpose, we would like to list a series models (A6M, A6MJ186,A6MJ186BK, Andy 6M) on reports and certificate, all the models are identical schematics, except for the differences as below,

1, it only difference is model number.

No other changes are made to them.

We confirm that all information above is true, and we'll be responsible for all the consequences. Please contact me if you have any question.
