Subject: Technical review questions on AK8DCRIP7

Hello,

The engineer has completed the technical review of this application. Below are his questions:

All bluetooth frequency hopping applications should include the following:
1. Please describe when the EUT enters into hybrid mode (per Section 15.247(f)), i.e., when in page and inquiry modes.
2. Please provide an example of the hopping sequence used by the EUT.
3. Please address Section 15.247(a)(1): does the EUT rx have an input bandwidth matching the transmitted signal bandwidth, and, does the EUT rx have the capability to hop in synchronization with the transmitted signal?
4. Does the EUT comply with Section 15.247(g) with respect to transmitting a lengthy data stream?
5. Does the EUT comply with Section 15.247(h) with respect to non-coordination?

The administrative issues are now comoplete, so when these technical issues are satisfied we will be ready to go. September 10 is still the projected date, correct?

Have a good day.
