3.0 DESCRIPTION OF TEST

3.1 Evaluation Procedure

The measurement procedure described in the American National Standard for Methods of Measurement of Radio-Noise Emission from Low-Voltage Electrical and Electronic Equipment in the Range of 9kHz to 40GHz (ANSI C63.4-2003) and FCC Public Notice DA 02-2138 dated August 30, 2002 entitled "Measurement Procedure Updated for Peak Transmit Power in the Unlicensed National Information Infrastructure (U-NII) Bands" were used in the measurement of **Sony Laptop with Bluetooth and WLAN FCC ID: AK8PCG41313L**.

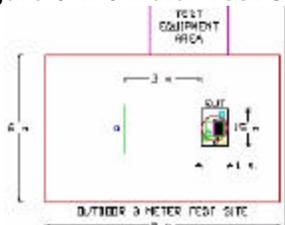

Figure 3-2. Dimensions of Outdoor Test Site

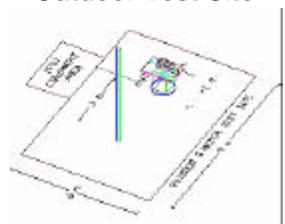

Figure 3-3. Turntable and System Setup

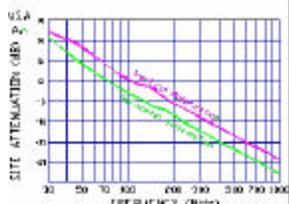

Figure 3-4. Normalized Site Attenuation Curves (H&V)

Preliminary measurements were made indoors at 1-meter using broadband antennas, broadband amplifiers, and spectrum analyzers to determine the frequency producing the maximum EME. Appropriate precaution was taken to ensure that all EME from the EUT were maximized and investigated. The system configuration, clock speed, mode of operation or video resolution, and turntable azimuth with respect to the antenna was noted for each frequency found. The spectrum was scanned from 30 to 200 MHz using a bi-conical antenna and from 200 to 1000 MHz using a log-spiral antenna. Above 1 GHz, linearly polarized double ridge horn antennas were used.

Final measurements were made outdoors at 3-meter test range using Roberts™ Dipole antennas or horn antennas (see Figure 3-1). The test equipment was placed on a wooden and plastic bench situated on a 1.5m x 2m area adjacent to the measurement area (see Figure 3-2). Sufficient time for the EUT, support equipment, and test equipment was allowed in order for them to warm up to their normal operating condition. The detector function was set to CISPR quasi-peak mode and the bandwidth of the spectrum analyzer was set to 100kHz for frequencies below 1GHz or 1MHz for frequencies above 1GHz. Above 1GHz the detector function was set to average mode (RBW = 1MHz, VBW = 10Hz).

The half-wave dipole antenna was tuned to the frequency found during preliminary radiated measurements. The EUT, support equipment and interconnecting cables were re-configured to the set-up producing the maximum emission for the frequency and were placed on top of a 0.8-meter high non-metallic 1 x 1.5 meter table (see Figure 3-3). The EUT, support equipment, and interconnecting cables were re-arranged and manipulated to maximize each EME emission. The turntable containing the system was rotated and the height of the receive antenna was varied 1 to 4 meters and stopped at the azimuth and height producing the maximum emission. Each emission was maximized by: varying the mode of operation or resolution; clock or data exchange speed; scrolling H pattern to the EUT and/or support equipment, and powering the monitor from the floor mounted outlet box and the computer aux AC outlet, if applicable; and changing the polarity of the antenna, whichever determined the worst-case emission. Photographs of the worst-case emission can be seen in the test setup photographs. Each EME reported was calibrated using the Agilent E8257D (250kHz – 20GHz) PSG Signal Generator. The Theoretical Normalized Site Attenuation Curves for both horizontal and vertical polarization are shown in Figure 3-4.

4.0 ANTENNA REQUIREMENTS

Excerpt from §15.203 of the FCC Rules/Regulations:

“An intentional radiator antenna shall be designed to ensure that no antenna other than that furnished by the responsible party can be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section.”

- The antennas of the Laptop with Bluetooth and WLAN are **permanently attached**.
- There are no provisions for connection to an external antenna.

Conclusion:

The **Sony Laptop with Bluetooth and WLAN** requirement of §15.203.

6.8 Peak Power Spectral Density (MIMO)

§15.407 (a)(1)

The peak power spectral density (PPSD) in this section is reported with the EUT transmitting with both transmitters (Chain A and Chain B) simultaneously in a completely uncorrelated fashion. Per Method #2 of the FCC KDB Publication 662911 titled "Emissions Testing of Transmitters with Multiple Outputs in the Same Band" dated April 4, 2011, the PPSD of each individual output is adjusted by a factor of $10\log(N)$, where N is the number of outputs. In the case of this EUT, the PPSD data reported in the original certification for this module under FCC ID: PD962230ANH is increased by 3dB ($N = 2$) and then compared to the PPSD limit in each respective UNII band for both 20MHz and 40MHz operation.

6.9 Radiated Spurious Emission Measurements

§15.407(b)(1), (2), (3), (6), §15.205, §15.209

The EUT was tested from 9kHz and up to the 10th harmonic of the fundamental frequency of the transmitter using CISPR quasi peak detector below 1GHZ. Above 1 GHz, peak measurements were taken using RBW = VBW = 1MHz and linearly polarized horn antennas and average measurements were taken using RBW = VBW = 10Hz. All out of band emissions appearing in a restricted band as specified in Section 15.205 of the Title 47 CFR must not exceed the limits shown in Table 6-29 per Section 15.209.

Note: All data rates and antennas were investigated for radiated spurious emissions. Transmissions from the Main antenna (Chain A) produced the worst case emissions while RF emissions from the Auxiliary (Chain B) and Simultaneous transmission of the Main and Auxiliary Antennas produced lower emissions. Radiated spurious emissions that were not at the band edges were found to be at their highest with the EUT transmitting with a 20MHz channel bandwidth.

- All harmonics that do not lie in a restricted band are subject to a peak limit of -27dBm/MHz.
- Data shown is for worst case mode and data rate. All modes (802.11a and 802.11n) were evaluated.
- All emissions that lie in the restricted bands (denoted by a * next to the frequency) specified in §15.205 are below the limit shown in Table 6-29.
- Peak Measurements > 1GHz using RBW = VBW = 1MHz. Average measurements >1GHz using RBW = 1MHz, VBW = 10Hz.
- The antenna is manipulated through typical positions, polarity and length during the tests. The EUT is manipulated through three orthogonal planes.
- The EUT is supplied with nominal AC voltage and/or a new/fully-recharged battery.
- The spectrum is measured from 9kHz to the 10th harmonic and the worst-case emissions are reported. No significant emissions were found beyond the fifth harmonic for this device.
- Levels at - 135 dBm represent the analyzer noise floor and signify that no emission was detected.
- Above 960MHz the limit is 500 µV/m (54dBµ/m) at 3 meters radiated.

NOTES:

- All harmonics that do not lie in a restricted band are subject to a peak limit of -27dBm/MHz.
- Data shown is for worst case mode and data rate. All modes (802.11a and 802.11n) were evaluated.
- All emissions that lie in the restricted bands (denoted by a * next to the frequency) specified in §15.205 are below the limit shown in Table 6-29.
- Peak Measurements > 1GHz using RBW = VBW = 1MHz. Average measurements >1GHz using RBW = 1MHz, VBW = 10Hz.
- The antenna is manipulated through typical positions, polarity and length during the tests. The EUT is manipulated through three orthogonal planes.
- The EUT is supplied with nominal AC voltage and/or a new/fully-recharged battery.
- The spectrum is measured from 9kHz to the 10th harmonic and the worst-case emissions are reported. No significant emissions were found beyond the fifth harmonic for this device.
- Levels at - 135 dBm represent the analyzer noise floor and signify that no emission was detected.
- Above 960MHz the limit is 500 µV/m (54dBµ/m) at 3 meters radiated.

- Levels at - 135 dBm represent the analyzer noise floor and signify that no emission was detected.
- Above 960MHz the limit is 500 μV/m (54dBμ/m) at 3 meters radiated.

Table 6-82. Radiated Restricted Band Measurements at 1-meter – Chain A (40MHz)

NOTES:

- All harmonics that do not lie in a restricted band are subject to a peak limit of -27dBm/MHz.
- Data shown is for worst case mode and data rate. All modes (802.11a and 802.11n) were evaluated.
- Peak Measurements > 1GHz using RBW = VBW = 1MHz. Average measurements >1GHz using RBW = 1MHz, VBW = 10Hz.
- The antenna is manipulated through typical positions, polarity and length during the tests. The EUT is manipulated through three orthogonal planes.
- The EUT is supplied with nominal AC voltage and/or a new/fully-recharged battery.
- The spectrum is measured from 9kHz to the 10th harmonic and the worst-case emissions are reported. No significant emissions were found beyond the fifth harmonic for this device.
- Levels at - 135 dBm represent the analyzer noise floor and signify that no emission was detected.
- Above 960MHz the limit is 500 μV/m (54dBμ/m) at 3 meters radiated.
