ENGINEERING STATEMENT

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported testing was carried out on a sample equipment to demonstrate limited compliance with FCC 47 CFR Part 15E, ISED RSS-247 and ISED RSS-GEN. The sample tested was found to comply with the requirements defined in the applied rules.

1.4   Product Information

1.4.1   Technical Description

The equipment under test was an Apple laptop computer with Bluetooth® and IEEE 802.11 a/b/g/n/ac/ax Wi-Fi in the 2.4 GHz and 5 GHz bands.

1.4.2   Test Modes

The EUT's 5 GHz 802.11 radio supported Single Input/Single Output (SISO) and 2x2 MIMO (Multiple Input/Multiple Output) modes. 802.11a supports 20 MHz bandwidth only. 802.11n supported 20 MHz and 40 MHz bandwidths and 802.11ac, and ax supported 20 MHz, 40 MHz and 80 MHz bandwidths.

802.11a mode supported SISO operation only. 802.11n and ac supported SISO, Cyclic Delay Diversity (CDD), Space Division Multiplexing (SDM) and Transmit Beamforming (TxBF) MIMO modes. 802.11ax supported SISO, CDD and SDM modes.

The EUT supported 802.11ax Single User (SU) operation in all bands. 802.11ax Multi-User (MU) was supported, however in U-NII-2A and U-NII-2C bands this was limited to Resource Unit (RU) sizes of 52 subcarriers or greater. In U-NII-1 and U-NII-3 MU modes were additionally supported for 26 subcarriers.

The EUT uses different output powers per core dependent on how many cores are used. The EUT also uses different power tables for Cyclic Delay Diversity (CDD), Space Division Multiplexing (SDM), and transmit beamforming (TxBF) modes. Preliminary results were performed to determine the worst-case modes for testing. It uses the same conducted power across all cores in any given mode, but due to the different antenna gains the radiated powers per core differ.

US and CA country codes changed the power table used for U-NII band 1. Therefore U-NII-1 channels were tested using both power settings for each country's respective limits.

Band edge tests were performed with multiple modulation types, with only the worst-cases reported. After band edge and additional preliminary investigations were performed to find worst-case operation, the EUT was tested in the following modes:

Spurious Radiated Emissions

SISO Mode (5 GHz Core 0):
* 802.11a – 6 Mbps

SISO Mode (5 GHz Core 1):
* 802.11a – 6 Mbps

2x2 MIMO Modes (Core 0+1 for U-NII-1 / 2A / 2C / 3):
* 802.11ac VHT20 – CDD (MCS0),
* 802.11ax HE20 MU RU26, RU52, SU – CDD (MCS0)

Maximum Conducted Output Power/PSD & Emission Bandwidth

SISO Modes (5 GHz Core 0 for U-NII-1 and Core1 for U-NII-2A / 2C / 3):
- 802.11a – 12 Mbps
- 802.11n HT20 – MCS2
- 802.11n HT40 – MCS2
- 802.11ac VHT80 - MCS2x1
- 802.11ax HE20 SU – MCS2x1
- 802.11ax HE40 SU – MCS2x1
- 802.11ax HE80 SU – MCS2x1
- 802.11ax HE20 MU RU26, RU52, RU106 – MCS2x1
- 802.11ax HE40 MU RU26, RU52, RU106 – MCS2x1
- 802.11ax HE80 MU RU26, RU52, RU106 – MCS2x1

2x2 MIMO Modes (Core 0+1 for U-NII-1 / 2A / 2C / 3):
- 802.11n/ac ((V)HT20* - CDD (MCS2), SDM (MCS10) and TxBF (MCS2)
- 802.11n/ac (V)HT40* - CDD (MCS2), SDM (MCS10) and TxBF (MCS2)
- 802.11ac VHT80 – CDD (MCS2x1), SDM (MCS2x1) and TxBF (MCS2x1)
- 802.11ax HE20 SU – CDD (MCS2x1) and SDM (MCS2x2)
- 802.11ax HE40 SU – CDD (MCS2x1) and SDM (MCS2x2)
- 802.11ax HE80 SU – CDD (MCS2x1) and SDM (MCS2x2)
- 802.11ax HE20 MU RU26, RU52, RU106 – CDD (MCS2x1) and SDM (MCS2x2)
- 802.11ax HE40 MU RU26, RU52, RU106 – CDD (MCS2x1) and SDM (MCS2x2)
- 802.11ax HE80 MU RU26, RU52, RU106 – CDD (MCS2x1) and SDM (MCS2x2)

Channel Move Time, Channel Closing Transmission Time and Non-Occupancy Period tests were limited to 802.11ac VHT80.

* = 802.11n HT modes were used for CDD and SDM and 802.11ac VHT modes were used for TxBF modes.

Reduced output power is used on the narrower 802.11ax multi-user (MU) modes to meet PSD and Band Edge limits. Therefore, only single user (SU) modes are reported for output power tests since these are always worst-case. All SU modes are reported for PSD and applicable MU modes of RU sizes of 26 to 106 subcarriers.

1.4.3   Test Setup

For conducted tests the EUT antennas were disconnected and replaced with U.FL to SMA test cables to enable conducted testing on each core. The loss of these test cables were known and compensated for in any conducted measurements.

For transmit beamforming (TxBF) modes the EUT was set up communicating with a support notebook computer provided by the applicant, configured with custom commands to act as an access point. The test laptop was also set to a low output power (approximately 0 dBm) so in conjunction with the rest of the set-up configuration, would give negligible power at the measuring equipment and would not affect the test result. The support laptop's test network set the channel and bandwidth to which the EUT could connect. The EUT then set up a communications link to the support laptop, operating in normal communications mode but with beamforming modes forced on, with auto rate and TPC disabled via terminal commands so the EUT could be limited to worst-case modes. The EUT transmit duty cycle was then maximized by using iPerf bandwidth testing software to keep the transmit output buffer full and generate more traffic from the EUT to the support laptop than the link could sustain. The EUT therefore could fully operate its beamforming mode but with strictly controlled test parameters.

For all other testing except DFS the EUT was put into a continuous transmit test mode with the chipset manufacturer's test commands via a script running in the EUTs terminal application. The EUT then transmitted the required type of packeted 802.11 data frames of fixed length, containing the standard headers and with pseudo-random data content, ensuring the measured signals were representative and contained all the symbols at the highest power control level.

The test setup used for DFS is described in the test result section of the present document.

1.4.4 Antenna Gain Table (5 GHz WLAN)

2.1.4 Test Method

Restricted Band Edge measurements were performed with the device operating in SISO and MIMO modes across the various modes supported by the device.

The measurements displayed within this report have been limited to those modes which have been shown to be worst case.

Where duty cycle corrections were required for average results, these are included in the result tables but are not shown on the plots.

Further measurements are held on file by TÜV SÜD and are available if required.
