8 Test Site Description

8.1 Radiated Emissions Test Site

Radiated measurements are performed in a 3m semi-anechoic chamber, which meets NSA requirements for the frequency range of 30MHz to 1000MHz. For measurements above 1 GHz, absorbers are laid out on the ground plane between the receiving antenna and the EUT to meet Site VSWR requirements in accordance with ANSI C63.4:2014.

8.1.1 Radiated Measurements in 30 MHz - 1000 MHz

The EUT is positioned on a turntable at a height of 80cm using a non-conducting table. A linearly polarized broadband antenna is positioned at 3m from the EUT periphery. The turntable is rotated 360 degrees and the antenna height varied from 1m to 4m to determine the highest emissions. This is repeated for both horizontal and vertical polarizations of the measurement antenna. All possible orientations of the EUT were investigated for emissions and the flat orientation was identified as the worst-case configuration.

8.1.2 Radiated Measurements above 1GHz

The EUT is positioned on a Turntable at a height of 1.5m. A Linearly polarized antenna is positioned at 3m from the EUT periphery. Guidelines in ANSI C63.10:2013 were followed with respect to maximizing the emissions. The measurement antenna is set at a fixed 1.5m height while the turntable is rotated 360 degrees and the EUT elevation angle is varied from 0 to 150 degrees in 30 degree increments to determine the highest emissions. This is repeated for both horizontal and vertical Polarizations of the Measurement Antenna. Measurements above 18GHz were performed at a 3m distance. Near field scanning is performed to identify frequencies above 1 GHz.

8.2 Antenna port conducted measurements

All antenna port conducted measurements were performed on a bench-top setup consisting of a spectrum analyzer, power meter (as necessary), splitters/combiners (as necessary), attenuators, and pre-characterized RF cables.

The correction factors between the EUT and the spectrum analyzer were added internally in the analyzer settings, where applicable. The plots displayed account for these correction factors.

9 Test Results- Conducted

9.1 Duty Cycle

9.1.1 Test Requirement:

Reporting and measurement purposes only.

9.1.2 Test Method:

Measurements were performed according to the procedure defined in ANSI C63.10:2013.

Spectrum Analyzer Settings:

RBW $\geq$ Occupied Bandwidth if possible; otherwise, set RBW to the largest available value

VBW $\geq$ RBW $\geq$ Signal Period

Detector = Peak

Span = 0 Hz

Sweep points > 100

Sample Calculations:

Duty Cycle (%) = $[(T_{on}) / (T_{on} + T_{off})] * 100$

If duty cycle >98% then the correction factor is 0, else the correction factor is calculated as follows.

Duty Cycle Correction Factor = $10 \log^*(1/DC) = 10 \log (1/0.92) = 0.362\text{dB}$.

9.1.3 Limits:

Reporting and measurement purposes only.

9.1.4 Test Results:

Frequency	Data Rate	On Time (ms)	Period (ms)	Duty Cycle (%)	Duty Cycle Correction Factor (dB)
2402	1-DH1	0.38	1.25	30.45	5.16

9.2 20dB and 99% Occupied Bandwidth

9.2.1 Test Requirement:

FCC CFR 47 Rule Part 15.247 (a)(1)(iii)

ISED RSS-247 [5.1]

9.2.2 Test Method:

Measurements were performed according to the procedure defined in ANSI C63.10:2013 Section 7.8.

Spectrum analyzer settings:

The x dB (-20dB) function on the spectrum analyzer was used to measure 20dB BW with the settings below:

Span = approximately 2 to 3 times the 20 dB or 99% Occupied bandwidth, centered on a hopping channel

RBW $\geq$ 1 to 5 % of the 20-dB bandwidth

VBW $\geq$ 3x RBW

Sweep = Auto

Detector function = Peak

Trace = Max Hold

The internal function of the spectrum analyzer is used to measure the 99% bandwidth.

Sample Calculations:

Corrected Amplitude: Amplitude (Analyzer level) + CL (Cable losses) = -25 dBm + 5 dB = -20dBm.

9.2.3 Limits:

N/A- Reporting Purposes only.

9.2.4 Test Results:

9.3 Output Power

9.3.1 Test Requirement:

FCC CFR 47 Rule Part 15.247 (b)(1)

ISED RSS-247 [5.4]

9.3.2 Test Method:

Measurements were performed according to the procedure defined in ANSI C63.10:2013 Section 7.8.

Spectrum analyzer settings:

Peak Power Measurements:

Span = approximately 5 times the 20 dB bandwidth, centered on a hopping channel= 5MHz

RBW > the 20 dB bandwidth of the emission being measured= 2MHz

VBW $\geq 3 \times$ RBW= 6MHz

Sweep = Auto

Detector function = Peak

Trace = Max Hold

The trace was allowed to stabilize. A Marker was set to the peak of the emission. The indicated level is the peak output power.

Sample Calculations:

Effective Isotropic Radiated Power (EIRP): Amplitude (Analyzer level) + CL (Cable losses) + Antenna Gain = -25 dBm + 5 dB +3 dBi = -17dBm.

9.3.3 Limits:

15.247/RSS-247: 1 Watt (30dBm), if ≥ 75 non-overlapping channels.

Additionally, for EDR modes and devices with ≤ 75 non-overlapping channels (AFH), 21dBm conducted.

RSS-247: 4 W (36dBm) EIRP.

Additionally, for EDR modes and devices with ≤ 75 non-overlapping channels (AFH), 27dBm EIRP.

9.4.2 Test Method:

Measurements were performed according to the procedure defined in ANSI C63.10:2013 Section 7.8. The EUT was in pseudorandom hopping mode with the separation of two peaks measured using the delta marker.

Spectrum analyzer settings:

Span = wide enough to capture the peaks of two adjacent channels

Resolution (or IF) Bandwidth (RBW) = 300 kHz

Video (or Average) Bandwidth (VBW) $\geq$ RBW = 3 MHz

Sweep = Auto

Detector function = Peak

Trace = Max Hold

The trace(s) was allowed to stabilize. The marker-delta function was used to determine the separation between the peaks of the adjacent channels.

Sample Calculations:

Channel Separation: High Channel Frequency – Low Channel Frequency = 2441 MHz – 2440 MHz = 1 MHz.

9.4.3 Limits:

The channel carrier frequencies must be separated by 25kHz or the 20dB BW of the hopping channel whichever is greater. If the output power is less than 125mW, then the channel separation can be 2/3 of the 20dB bandwidth 623.33kHz or 25kHz whichever is greater.

9.4.4 Test Results:

Pass.

Minimum channel separation= 1.0 MHz in 1-DH5 Mode.

9.5.2 Test Method:

Measurements were performed according to the procedure defined in ANSI C63.10:2013 Section 7.8. The EUT had its hopping function enabled.

Spectrum analyzer settings:

Span = the frequency band of operation

RBW < 30% of the OBW = 300 kHz

VBW $\geq$ RBW = 3 MHz

Sweep = Auto

Detector function = Peak

Trace = Max Hold

The trace was allowed to stabilize, and the number of channels was counted.

9.5.3 Limits:

The minimum number of hopping channels required is 15.

9.5.4 Test Results

Pass.

The EUT utilizes 79 hopping channels in BDR and EDR modes. In AFH mode, the EUT utilizes a minimum of 20 hopping channels.

9.6.2 Test Method:

Measurements were performed according to the procedure defined in ANSI C63.10:2013 American National Standard of Procedure for Compliance Testing of Unlicensed Wireless Devices, Section 7.8. The EUT had its hopping function enabled.

Spectrum analyzer settings:

Span = zero span, centered on a hopping channel

RBW = 100 kHz

VBW $\geq 3 \times$ RBW= 300 kHz

Sweep = as necessary to capture the entire dwell time per hopping channel = 4ms

Detector function = Peak

Trace = Clear Write/ Trigger Mode

Dwell Time is measured with analyzer set to zero span at the middle channel and the trigger set to capture a burst.

Sample Calculations:

From the csv plot for 31.6s, total number of ON time is calculated.

Multiplying the ON time with time resolution (microseconds) and converting this to milliseconds provides the Accumulated dwell time.

Accumulated Dwell Time = $(465 \times 0.00079) \times 1000 = 397.381\text{ms}$

9.6.3 Limits:

400 ms within 31.6s (400 ms $\times$ 79 Channels)

9.6.4 Test Results:

Pass.

Packet Type	Accumulated Dwell Time in 31.6 s period (ms)	Limit (ms)
1-DH1	367.381	400.000
1-DH3	395.033	400.000
1-DH5	364.220	400.000
