9.5 Power Spectral Density

9.5.1 Test Requirement:

FCC CFR 47 Rule Part 15.247 (e)
ISED RSS-247 Issue 1 [5.2]

9.5.2 Test Method:

Measurements were performed according to the procedure defined in KDB 558074- Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating Under §15.247 V05 and ANSI C63.10: 2013.

Spectrum Analyzer settings:

Set analyzer center frequency to DTS channel center frequency.

Span to 1.5 times the DTS bandwidth

RBW: $3 \text{ kHz} \leq \text{RBW} \leq 100 \text{ kHz}$

VBW $\geq 3 \text{ RBW}$

Detector = Peak

Sweep time = auto couple

Trace mode = max hold

Use the peak marker function to determine the maximum amplitude level within the RBW

If measured value exceeds limit, reduce RBW (no less than 3 kHz) and repeat.

9.5.3 Sample Calculation:

For MIMO, the total average PSD is calculated as follows,

$$\text{Total PSD} = 10 * \text{LOG} ((10^{(\text{PSD}_{(\text{Chain } 0)})/10}) + 10^{(\text{PSD}_{(\text{Chain } 1)})/10})$$

$$\text{For e.g. Total PSD} = 10 * \text{LOG} (10^{(3.41/10)} + 10^{(2.41/10)}) = 5.94 \text{ dBm}/100 \text{ kHz}$$

9.5.4 Limits:

The maximum permissible power density is 8 dBm/3kHz, however if the antenna gain is >6dBi, the limit is reduced by the total Directional Antenna Gain –6dBi.

In this case:

Correlated Directional gain = 6.02dBi.

Test limits are adjusted to 7.98dBm/3kHz here.

9.5.5 Test Results:

The test data shows that the EUT passes the requirement using 100kHz RBW setting and hence will meet the requirement for 3kHz BW.
