

The following SAR report is for Spacelab's 91341-09 device. Spacelabs has submitted this report to show compliance for the 91343-09 and 91347-09 devices. They have provided the following justification:

The 91343-09 and 91347-09 transmitters use the same RF board and antenna as the 91341-09, with slight modifications to the RF board that increase the occupied bandwidth.

The maximum SAR measured on the 91341-09 was 0.082 mW/g according to the CCS SAR Report 03U2243-1, dated 10/13/03, on the 91341-09, well below the allowed 1.600 mW/g for partial body exposure. The radio boards are the same except for the circuitry changed to create the wider bandwidth for the 91343 and 91347 transmitters.
