The test methodology followed during the collection of the data included within this technical report was ANSI C63.4:1992.

The EUT was powered with (120) VAC / (60) Hz during the collection of data included within.

The data is compared to the FCC Class B limits.

The "EMI" instrumentation is capable of calculating the final emission level based on the following formula:

Level at the receiver (dBμV) + Antenna Correction Factor (dB/M) + Cable Loss (dB) - Preamp Gain (dB) = Actual Level in dBμV/M.

The sample calculation below is based on the actual test data collected:

Observed Level		**48.6**	dBμV	
ACF	+	**19.7**	dB/M	
Cable Loss	+	**3.2**	dB	
Preamp Gain	-	**26.0**	dB	
Actual Level		**45.5**	dBμV/M	@ 604.0 MHZ

Please have a company official review this report and sign.
