The responses are as follows:

The Test Report shows Channel 1 in OFDM mode is 5dB below the other reported powers for the mid and high channels. We do not see this same drop in power on Channel 1 when the equipment is in CCK mode. Please advise. Is the equipment working properly? Was the test equipment and cables operating properly.

Response:

That's because the bandedge which we tested for Channel 1, will be high emission level.

So we have to reduce our power setting for OFDM.
