

RADIO TEST REPORT

Test Report No. 15310343H-A-R1

Customer	DENSO CORPORATION
Description of EUT	Millimeter Wave Radar Sensor
Model Number of EUT	DNMWR015
FCC ID	HYQDNMWR015
Test Regulation	FCC Part 95 Subpart M
Test Result	Complied
Issue Date	August 29, 2024
Remarks	*For Permissive Change

Representative test engineerYuichiro Yamazaki
Engineer**Approved by**Ryota Yamanaka
Engineer

CERTIFICATE 5107.02

- ☐ The testing in which "Non-accreditation" is displayed is outside the accreditation scopes in UL Japan, Inc.
☒ There is no testing item of "Non-accreditation".

Report Cover Page - Form-ULID-003532 (DCS:13-EM-F0429) Issue# 23.0

ANNOUNCEMENT

- This test report shall not be reproduced in full or partial, without the written approval of UL Japan, Inc.
- The results in this report apply only to the sample tested. (Laboratory was not involved in sampling.)
- This sample tested is in compliance with the limits of the above regulation.
- The test results in this test report are traceable to the national or international standards.
- This test report must not be used by the customer to claim product certification, approval, or endorsement by the A2LA accreditation body.
- This test report covers Radio technical requirements.
It does not cover administrative issues such as Manual or non-Radio test related Requirements. (if applicable)
- The all test items in this test report are conducted by UL Japan, Inc. Ise EMC Lab.
- The opinions and the interpretations to the result of the description in this report are outside scopes where UL Japan, Inc. has been accredited.
- The information provided by the customer for this report is identified in SECTION 1.
- The laboratory is not responsible for information provided by the customer which can impact the validity of the results.
- For test report(s) referred in this report, the latest version (including any revisions) is always referred.

REVISION HISTORY

Original Test Report No.: 15310343H-A

This report is a revised version of 15310343H-A. 15310343H-A is replaced with this report.

Revision	Test Report No.	Date	Page Revised Contents
- (Original)	15310343H-A	July 24, 2024	-

SECTION 1: Customer Information

Company Name	DENSO CORPORATION
Address	1-1, Showa-cho, Kariya-shi, Aichi-ken, 448-8661 Japan
Telephone Number	+81-566-56-0051
Contact Person	Yuko Suzuki

The information provided by the customer is as follows;

- Customer, Description of EUT, Model Number of EUT, FCC ID on the cover and other relevant pages
- Operating/Test Mode(s) (Mode(s)) on all the relevant pages
- SECTION 1: Customer Information
- SECTION 2: Equipment Under Test (EUT) other than the Receipt Date and Test Date
- SECTION 4: Operation of EUT during testing

SECTION 2: Equipment Under Test (EUT)

2.1 Identification of EUT

Description	Millimeter Wave Radar Sensor
Model Number	DNMWR015
Serial Number	Refer to SECTION 4.2
Condition	Production model
Modification	No Modification by the test lab
Receipt Date	June 13, 2024
Test Date	June 13 to 19, 2024

2.2 Product Description

General Specification

Rating	DC 12 V (Car battery), DC 9 V to 16 V (Operating range)
Operating temperature	-30 deg. C to +85 deg. C

Radio Specification

Equipment Type	Transceiver
Frequency of Operation	76.5 GHz
Bandwidth	500 MHz (Max.), 450 MHz (Typ.)
Type of Modulation	FM-CW
Antenna Gain	21.5 dBi
Steerable Antenna	Electronically (Receiving Part only)
Usage location	Forward-looking, vehicle-mounted

SECTION 3: Test specification, procedures & results

3.1 Test Specification

Test Specification	FCC Part 95 Subpart M The latest version on the first day of the testing period
Title	FCC 47CFR Part95 – PERSONAL RADIO SERVICES Subpart M – The 76-81 GHz Band Radar Service

3.2 Procedures and results

Item	Test Procedure	Specification	Worst margin	Results	Remarks
Conducted emission	FCC: N/A	FCC: N/A	N/A	N/A	*1)
Occupied bandwidth	FCC: ANSI C63.26-2015 5.4 Occupied bandwidth	FCC: Section 2.1049	See data.	Complied	Radiated
Radiated Power Modulation characteristics	FCC: ANSI C63.26-2015 5.5 Radiated emissions testing ANSI C63.10-2013 6. Standard test methods 9. Procedures for testing millimeter-wave systems	FCC: Section 95.3367 Section 2.1046 Section 2.1047		Complied	Radiated
Field strength of spurious radiation	FCC: ANSI C63.26-2015 5.5 Radiated emissions testing	FCC: Section 95.3379 (a) Section 2.1053 Section 2.1057	No signal detected	Complied	Radiated
Frequency stability	FCC: ANSI C63.26-2015 5.6 Frequency stability testing	FCC: Section 95.3379 (b) Section 2.1055	See data.	Complied	Radiated

Note: UL Japan, Inc.'s EMI Work Procedures: Work Instructions-ULID-003591 and Work Instructions-ULID-003593.
* In case any questions arise about test procedure, ANSI C63.10-2013, ANSI C63.26-2015 and KDB653005 are also referred.

*1) The test is not applicable since the EUT is not the device that is designed to be connected to the public utility (AC) power line.

Supplied Voltage Information

This EUT provides stable voltage constantly to RF Module regardless of input voltage.

Antenna Information

The antenna is not removable from the EUT.

3.3 Addition to standard

No addition, exclusion nor deviation has been made from the standard.

3.4 Uncertainty

Measurement uncertainty is not taken into account when stating conformity with a specified requirement.
Note: When margins obtained from test results are less than the measurement uncertainty, the test results may exceed the limit.

The following uncertainties have been calculated to provide a confidence level of 95 % using a coverage factor $k = 2$.

Radiated emission

Measurement distance	Frequency range	Unit	Calculated Uncertainty (+/-)
3 m	9 kHz to 30 MHz	dB	3.3
10 m		dB	3.1
3 m	30 MHz to 200 MHz	Horizontal	4.7
		Vertical	4.7
	200 MHz to 1000 MHz	Horizontal	4.8
		Vertical	6.0
10 m	30 MHz to 200 MHz	Horizontal	5.2
		Vertical	5.1
	200 MHz to 1000 MHz	Horizontal	5.2
		Vertical	5.2
3 m	1 GHz to 6 GHz	dB	5.0
	6 GHz to 18 GHz	dB	5.2
1 m	10 GHz to 18 GHz	dB	5.3
	18 GHz to 26.5 GHz	dB	5.2
	26.5 GHz to 40 GHz	dB	4.7
0.5 m	26.5 GHz to 40 GHz	dB	4.8
>= 0.5 m	40 GHz to 50 GHz	dB	4.3
	50 GHz to 75 GHz	dB	5.9
	75 GHz to 110 GHz	dB	5.7
>= 3.8 cm	110 GHz to 170 GHz	dB	5.8*
>= 2.5 cm	170 GHz to 260 GHz	dB	5.2*

*under consideration about Uncertainty for testing at 1 cm distance.

Radiated emission (with Block downconverter)

Measurement distance	Frequency range	Uncertainty (+/-)
>= 0.5 m	75 GHz to 83 GHz	3.4 dB*

* This value was used for 75 GHz to 83 GHz in this report.

1	DC Cable	4.1	Unshielded	Unshielded	-
2	Signal Cable	4.1	Unshielded	Unshielded	-

SECTION 5: Radiated Spurious Emission

Test Procedure

[For below 30 MHz]

The EUT was placed on a urethane platform of nominal size, 1.0 m by 1.5 m, raised 0.8 m above the conducting ground plane.

The Radiated Electric Field Strength has been measured in a Semi Anechoic Chamber with absorbent materials lined on a ground plane.

The loop antenna was fixed height at 1.0 m.

The EUT was rotated a full revolution in order to obtain the maximum value of the electric field intensity.

The measurements were performed for vertical polarization (antenna angle: 0 deg., 45 deg., 90 deg., 135 deg., and 180 deg.) and horizontal polarization.

*Refer to Figure 1 about Direction of the Loop Antenna.

[For above 30 MHz, up to 1 GHz]

The EUT was placed on a urethane platform of nominal size, 1.0 m by 1.5 m, raised 0.8 m above the conducting ground plane. The Radiated Electric Field Strength has been measured in a Semi Anechoic Chamber with a ground plane.

The height of the measuring antenna varied between 1 m and 4 m and EUT was rotated a full revolution in order to obtain the maximum value of the electric field strength.

[For above 1 GHz, up to 40 GHz]

The EUT was placed on a urethane platform of nominal size, 0.5 m by 0.5 m, raised 1.5 m above the conducting ground plane.

The Radiated Electric Field Strength has been measured in a Semi Anechoic Chamber with absorbent materials lined on a ground plane.

The height of the measuring antenna varied between 1 m and 4 m and EUT was rotated a full revolution in order to obtain the maximum value of the electric field strength.

Test antenna was aimed at the EUT for receiving the maximum signal and always kept within the illumination area of the 3 dB beamwidth of the antenna.

The measurements were performed for both vertical and horizontal antenna polarization with the Test Receiver, or the Spectrum Analyzer.

The measurements were made with the following detector function of the test receiver and the Spectrum analyzer.

The test was made with the detector (RBW/VBW) in the following table.

Test Antennas are used as below;

Frequency	Below 30 MHz	30 MHz to 200 MHz	200 MHz to 1 GHz	Above 1 GHz
Antenna Type	Loop	Biconical	Logperiodic	Horn

Frequency	9 kHz to 150 kHz	150 kHz to 30 MHz	30 MHz to 1 GHz	1 GHz to 40 GHz
Instrument used	Test Receiver			Spectrum Analyzer
Detector	CISPR QP, Average	CISPR QP, Average	CISPR QP	Average *1)
IF Bandwidth	200 Hz	9 kHz	120 kHz	RBW: 1 MHz VBW: 3 MHz

*1) A RMS average mode was applied according to KDB653005 4 (b) and 5.4 (f).

[Test setup]
Below 1 GHz

x : Center of turn table

Test Distance: 3 m

1 GHz to 10 GHz

r : Radius of an outer periphery of EUT
x : Center of turn table

Distance Factor: $20 \times \log(4.0 \text{ m}^* / 3.0 \text{ m}) = 2.5 \text{ dB}$
* Test Distance: $(3 + \text{Test Volume} / 2) - r = 4.0 \text{ m}$

Test Volume: 2 m
(Test Volume has been calibrated based on CISPR 16-1-4.)
 $r = 0.0 \text{ m}$

* The test was performed with $r = 0.0 \text{ m}$ since that yielded the worst emission levels from the EUT.

10 GHz to 26.5 GHz

x : Center of turn table

Distance Factor: $20 \times \log(1.0 \text{ m}^* / 3.0 \text{ m}) = -9.5 \text{ dB}$
*Test Distance: 1 m

26.5 GHz to 40 GHz

x : Center of turn table

Distance Factor: $20 \times \log(0.5 \text{ m}^* / 3.0 \text{ m}) = -15.6 \text{ dB}$
*Test Distance: 0.5 m

Figure 1: Direction of the Loop Antenna

Side View (Vertical)

Top View (Horizontal)

Antenna was not rotated.

Top View (Vertical)

[Above 40 GHz (Expept for fundamental measurement)]

The test was performed based on “Procedures for testing millimeter-wave systems” of ANSI C63.10-2013.

The EUT was placed on a urethane platform, raised 1.5 m above the conducting ground plane.

The measurements were performed on handheld method.

Set spectrum analyzer RBW, VBW, span, etc., to the proper values. Note these values. Enable two traces—one set to “clear write,” and the other set to “max hold.” Begin hand-held measurements with the test antenna (horn) at a distance of 1 m from the EUT in a horizontally polarized position. Slowly adjust its position, entirely covering the plane 1 m from the EUT. Observation of the two active traces on the spectrum analyzer will allow refined horn positioning at the point(s) of maximum field intensity. Repeat with the horn in a vertically polarized position. If the emission cannot be detected at 1 m, reduce the RBW to increase system sensitivity. Note the value. If the emission still cannot be detected, move the horn closer to the EUT, noting the distance at which a measurement is made.

Note the maximum level indicated on the spectrum analyzer. Adjust this level, if necessary, by the antenna gain, filter loss, conversion loss of the external mixer and gain of LNA used, at the frequency under investigation. Calculate the field strength of the emission at the measurement distance from the Friis’ transmission equation.

The final test was performed with a 1 MHz RMS detctor at the following distances;

[Test setup]

40 GHz to 50 GHz

※: Center of turn table

*Test Distance: 1.0 m

Above 50 GHz

※: Center of turn table

*Test Distance:

50 GHz to 75 GHz	1.0 m
75 GHz to 76 GHz	1.0 m
81 GHz to 83 GHz	1.0 m
83 GHz to 110 GHz	0.5 m
110 GHz to 231 GHz	0.01 m

The test results and limit are rounded off to one decimal place, so some differences might be observed.

The noise levels were confirmed at each position of X, Y and Z axes of EUT to see the position of maximum noise, and the test was made at the position that has the maximum noise.

[About fundamental measurement]

The test was performed based on "Procedures for testing millimeter-wave systems" of ANSI C63.10-2013.

The EUT was placed on a urethane platform, raised 1.5 m above the conducting ground plane. The measurements were performed on handheld method.

The carrier levels were confirmed at maximum direction of transmission. The maximum direction was searched under carefully since beam-widths are extremely narrow.

The carrier levels were measured in the far field. The distance of the far field was calculated from follow equation.

$$r = \frac{2D^2}{\lambda}$$

where

r is the distance from the radiating element of the EUT to the edge of the far field, in m

D is the largest dimension of both the radiating element and the test antenna (horn), in m

(The antenna aperture size of test antenna was used for this calculation.)

λ is the wavelength of the emission under investigation [$300/f$ (MHz)], in m

Frequency [GHz]	Wavelength λ [mm]	Maximum Dimension			Far Field Boundary r [m]	Tested Distance [m]
		EUT [m]	Test Antenna [m]	Maximum D [m]		
77	3.9	0.057000	0.025150	0.057000	1.668	1.8

The Radiated power test was performed with the EUT that was attached on the jig, since the antenna array was mounted on angularly-tilted.

The Peak Power results was applied to the desensitization correction factor by KDB653005 4 (c) and 5.4 (d).

The derivation of the FMCW Desensitization Factor is given in Keysight Application Note 5952 1039 Appendix B.

Desensitization factor was calculated from follow equation;

$$\alpha = \frac{1}{\sqrt[4]{1 + \left(\frac{2 \ln(2)}{\pi}\right)^2 \left(\frac{F_s}{T_s B^2}\right)^2}}$$

and

FMCW Desensitization factor = 20 Log (α)

Where

F_s is FMCW Sweep Width or Chirp Width, is used the actual measurement value.

T_s is FMCW Sweep Time, is referred to the values in the specifications.

B is -3dB Bandwidth of Gaussian RBW Filter, is used the actual measurement value.

F_s [MHz]	T_s [us]	B [MHz]	α	FMCW Desensitization factor [dB]
400.2154	412.0	1.0	0.959	-0.37

The test results and limit are rounded off to one decimal place, so some differences might be observed.

Measurement range : 9 kHz to 231 GHz

Test data : APPENDIX

Test result : Pass

SECTION 6: Frequency Stability

Test Procedure

The block downconverter was placed in side of the temperature chamber's drain hole.

The power supply was set to nominal operating voltage (110 %), and the spectrum mask was measured at 20 deg. C. After that, EUT power supply was varied between 85 % and 115 % of nominal voltage and the frequency excursion of the EUT emission mask was recorded.

The EUT operating temperature was raised to 50 deg. C, and the frequency excursion of the EUT emission mask was recorded. Measurements were repeated at each 10 deg. C decrement down to -20 deg. C.

Both lower and upper frequencies of the -20 dB Bandwidth were recorded.

Test data : APPENDIX
Test result : Pass

APPENDIX 1: Test data

Occupied bandwidth

Test place	Ise EMC Lab.
Semi Anechoic Chamber	No. 4
Date	June 13, 2024
Temperature / Humidity	21 deg. C / 45 % RH
Engineer	Yuichiro Yamazaki
Mode	Normal operating mode (Mode 2)

99 % Occupied bandwidth [MHz]
400.2154

[Data]

The measurement was performed with Peak detector and Max Hold since the duty cycle was not 100 %.

Radiated Power

Normal operating mode (Mode 2)

Power	Freq.	Measured Power	Rx Ant. Gain	Down Converter Gain	IF Cable Loss	Tested Distance	FSL	Duty Factor	FMCW desensitization Factor	EIRP		Limit	Margin
										[dBm]	[mW]		
Average	76.500	-20.51	23.06	15.06	1.70	1.8	75.22	7.94	-	26.23	419.76	50	23.77
Peak	76.362	-11.93	23.05	14.94	1.67	1.8	75.20	-	-0.37	27.32	539.51	55	27.68

Calculating formula:
FSL (Free Space path Loss) = 10 * log10((4 * Pi * Tested Distance / Lambda) ^2)
Average EIRP = Measured Power - Rx Ant. Gain - Down Converter Gain + IF Cable Loss + FSL + Duty Factor
Peak EIRP = Measured Power - Rx Ant. Gain - Down Converter Gain + IF Cable Loss + FSL - FMCW desensitization factor

The test method referred to KDB653005 4 and 5.4.
The derivation of the Duty Factor is given in Duty data page.
The derivation of the FMCW Desensitization Factor is given in Keysight Application Note 5952 1039
Appendix B. (Refer Section 5)

Calculation:
FSL (Free Space path Loss) = 10 * log ((4 * Pi * D / λ)²)
EIRP = Reading - Rx Ant. gain + Filter loss - LNA gain + Mixer conversion loss - IF Amp. gain + IF Cable loss + FSL
Power density Result at 3 m = EIRP / (4 * Pi * 300²)

These calculation results are same as results which were calculated with formulas described in the Section 9 of ANSI C63.10-2013.

- The equipment were not used for factor 0 dB of the data sheets.
 - The Mixer conversion loss and IF Cable Loss are automatically corrected in the mixer, so the factor of data sheet were 0 dB.
 - The IF Cable loss is included in Mixer loss, so the factor of data sheet were 0 dB.
- NS: No signal detected.

[Plot data, Worst case]

*These plots data contains sufficient number to show the trend of characteristic features for EUT.

Frequency Stability

Test place Ise EMC Lab.

*Hyphens for Last Calibration Date and Cal Int (month) are instruments that Calibration is not required (e.g. software), or instruments checked in advance before use.

The expiration date of the calibration is the end of the expired month.

As for some calibrations performed after the tested dates, those test equipment have been controlled by means of an unbroken chains of calibrations.

All equipment is calibrated with valid calibrations. Each measurement data is traceable to the national or international standards.

Test Item: RE: Radiated Emission
