## PRODUCT SAFETY AND COMPLIANCE EMC LABORATORY

EMC TEST REPORT

**Test Report Number** – 21541-1

Report Date – February 18, 2008

The test results contained herein relate only to the model(s) identified. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical characteristics.

As the responsible EMC Engineer, I hereby declare that the equipment tested as specified in this report conforms to the requirements indicated.

Signature:

Name: Albert J. Patapack

Title: EMC Engineer Date: February 18, 2008

This report must not be reproduced, except in full, without written approval from this laboratory.

THIS REPORT MUST NOT BE USED TO CLAIM PRODUCT ENDORSEMENT BY A2LA OR ANY AGENCY OF THE U.S. GOVERNMENT.

A2LA Certificate Number: 2518-02

## **Test Report Details**

Tests Performed By: Motorola Mobile Devices business (MDb)

Product Safety and Compliance Group

600 North US Hwy 45 Libertyville, IL 60048

PH (847) 523-6167 Fax (847) 523-4538 Motorola MDb FRN: 0004321311 FCC Registration Number: 316588 Industry Canada Number: IC3908-1

Tests Requested By: Motorola Inc.

Mobile Devices Business 600 North US Hwy 45 Libertyville, IL 60048

Product Type: Cellular Phone

Signaling Capability: CDMA 800, CDMA 1900, EV-EO Rev0, Bluetooth

FCC ID: IHDT56JH1

Serial Numbers: 80D36724, 80E1DB33, 8015F830,

80443F01, 80D1F0E8

Testing Complete Date: February 8, 2008

## **Applicable Standards**

All tests and measurements indicated in this document were performed in accordance with the Code of Federal Regulations Title 47 Part 2, Sub-part J as well as the following parts:

X Part 15 Subpart B – Unintentional Radiators

X Part 22 Subpart H - Public Mobile Services

X Part 24 Subpart E – Personal Communications Services

Applicable Standards: TIA EIA 137-A, TIA EIA 98-C, ANSI 63.4 2001, RSS-118 (AMPS), RSS-128 (TDMA), RSS-129 (CDMA), RSS-133 (PCS)

## **Summary of Testing**

Test	Test Name	D (D )
#		Pass/Fail
1	RF Power Output	NA
2	ERP (Effective Radiated Power)	Pass
3	EIRP (Effective Isotropic Radiated Power)	Pass
4	Occupied Bandwidth	Pass
5	Spurious Emissions at Antenna Terminal	Pass
6	Field Strength of Spurious Emissions	Pass
7	Frequency Stability	Pass
8	Field Strength of Spurious Emissions	Pass
	from Unintentional Radiators	
9	AC Line Conducted Emissions	Pass
Test	Test Name	Margin with respect
Test #	Test Name	Margin with respect to the Limit

The margin with respect to the limit is the minimum margin for all modes and bands.

## **General and Special Conditions**

The EUT was tested using a fully charged battery when applicable. Where a battery could not be used due to the need for a controlled variation of input voltage, an external power supply was utilized.

All testing was done in an indoor controlled environment with an average temperature of 22° C and relative humidity of 50%.

## **Equipment and Cable Configurations**

The EUT was tested in a stand-alone configuration that is representative of typical use.

ETS	LISN	3810/2NM	62907	5/02/2008
ETS	LISN	3810/2NM	62912	5/02/2008

All testing was performed using equipment that was within calibration at the time that the test was performed. No equipment listed in the table above was used after the specified calibration due date. If, during the course of product testing, a piece of equipment went out of calibration and that piece of equipment was needed to complete product testing, a similar piece of calibrated equipment was substituted. If a substitution was made, that new piece of equipment would be listed in the above table along with the piece that was removed from service. Note that the Agilent power meter is on a two-year calibration cycle. All other equipment is on a one-year calibration cycle.

Test Report Number: 21531-1 5 of 32 EXHIBIT 6

## **Measurement Procedures and Data**

## RF POWER OUTPUT

## **Measurement Procedure**

The RF output port of the equipment under test is directly coupled to the input of an Agilent power meter through a 30dB passive attenuator, adaptor (if needed), and specialized RF connector. The peak power output is measured for all channels.

CFR47 Part 2.1046

### **Measurement Results**

#### **CDMA 800**

Frequency (MHz)	Power (dBm)
824.70	25.01
836.52	24.88
848.31	24.88

#### **CDMA 1900**

Frequency (MHz)	Power (dBm)
824.70	25.00
836.52	24.90
848.31	24.90

Conducted Power was measured according to the "SAR Measurement Procedure for 3G Devices" released on October, 2007.

Based on the power measurements, the 800 band testing was performed in RC3/SO55 CDMA mode and the 1900 band testing was performed in EV-DO Rev0 FTAP mode.

Conducted power (dBm) for CDMA modes							
	Channel	RC1		RC3		RC3 (FCH + SCH)	
	Chamilei	SO2	SO55	SO2	SO55	RC3 (FCH + SCH)	
CDMA	1013	25.10	25.13	24.98	25.01	D. M. 4 1 1	
800	384	25.00	24.98	24.89	24.88	Per Motorola designs, the maximum	
800	777	24.99	25.00	24.86	24.88	power, when in a mode that allows supplemental channels, will always	
CDMA	25	25.05	25.06	24.94	25.00	be less than the RC3/RC1	
1900	600	25.00	25.01	24.90	24.90	maximum conducted power limit.	
1900	1175	25.04	24.99	24.91	24.90	maximum conducted power mint.	

Conducted power (dBm) for EV-DO modes					
	Channel EV-DO Rev 0				
	Channel	FTAP	RTAP		
CDMA	1013	24.90	25.13		
800	384	24.76	25.00		
800	777	24.65	24.95		
CDMA	25	25.47	25.24		
1900	600	25.40	25.12		
1300	1175	25.32	25.07		

## RADIATED POWER (EIRP AND ERP)

## **Measurement Procedure**

The phone was tested in a 16' anechoic chamber with a 2-axis position system that permits taking complete spherical scans of the EUT's radiation patterns. For all tests, the phone was supported in a free space type environment, vertically oriented in the chamber. Tests were done for 800 CDMA and 1900 EV-DO Rev0 FTAP.

All measurements were made with the phone placed in a call using a mobile station test set. The phone was weakly coupled to the test set and configured to transmit in full data rate mode. Radiated power was measured at each 15 degree step. The radiated power was measured using a Gigatronics 8652 power meter in "Mod Avg" mode for CDMA or in the "Burst Avg" mode for GSM. From these measurements, the software calculates the angle at which maximum radiated power occurs for each case, and the radiated power at this angle was extracted from the data. To get ERP (effective radiated power referenced to a half-wave dipole), subtract 2.1 dB from these numbers.

#### **Measurement Results**

#### **800 CDMA:**

Frequency (MHz)	ERP (dBm)
824.70	22.58
836.52	23.15
848.31	22.58

#### 1900 EV-DO Rev0 FTAP:

Frequency (MHz)	EIRP (dBm)
1851.25	25.70
1880.00	25.56
1908.75	24.94

For all measurement, calibration was performed via gain substitution with a half-wave dipole.

BAND/TECHNOLOGY	MAXIMUM EIRP(dBm)	MAXIMUM ERP (dBm)
800 CDMA	25.25	23.15
1900 EV-DO Rev0 FTAP	25.70	23.60

## OCCUPIED BANDWIDTH

## **Measurement Procedure**

The RF output port of the equipment under test is directly coupled to the input of the EMC analyzer through a specialized RF connector and a 10dB passive attenuator. The amplitude of the spectrum analyzer is corrected for the attenuator and any other applicable losses. The analyzer is set for Peak Detector and each trace is set for Max Hold. A fully charged battery was used for the supply voltage.

The middle channel within the designated frequency block was measured. For digital modulation, the lower and upper band edge plots are displayed.

Measurement Results Attached

#### **Measurement Results –800 CDMA**

	Equipment Settings					
Plot	Resolution Bandwidth (kHz)	Video Bandwidth (kHz)	Sweep Points (#)	Trace Mode	Detector	Samples (≥#)
Reference Plot - CDMA 800	3000	Auto	2001	Max Hold	Peak	100
OCBW - CDMA 800	30	Auto	1601	Max Hold	Peak	100
Lower Band Edge - CDMA 800	1	Auto	2004	Max Hold	Peak	30
Upper Band Edge - CDMA 800	1	Auto	2004	Max Hold	Peak	30

- Notes: 1) When the video bandwidth is set to Auto the video bandwidth self adjusts for 3 the resolution bandwidth.
  - 2) The plotted data shown for the band edge measurements is representative of data taken with a true 13 kHz resolution bandwidth filter. The raw data was taken using a 1 kHz resolution bandwidth and was integrated to produce a response representative of data taken using a true 13 kHz resolution bandwidth filter.

9 of 32 **EXHIBIT 6** Test Report Number: 21531-1

800 CDMA - Reference Level Plot - Channel 384 (836.52MHz)

## SPURIOUS EMISSIONS AT ANTENNA TERMINALS

## **Measurement Procedure**

The RF output port of the Equipment Under Test is directly coupled to the input of the EMC analyzer through a specialized RF connector and a 10dB passive attenuator. A fully charged battery was used for the supply voltage.

The spectrum was investigated from the lowest frequency signal generated, without going below 9 kHz, up to at least the tenth harmonic of the fundamental or 40 GHz, whichever is lower.

The spectrum analyzer settings were as follows:

Units dBm Divisions 10 dB

Detector Peak Detector

Resolution Bandwidth 1 MHz Video Bandwidth (AVG) Auto Sweep Time Auto

The margin with respect to the limit is the minimum margin for all modes and bands.

Test Report Number: 21531-1 16 of 32 EXHIBIT 6

## FIELD STRENGTH OF SPURIOUS EMISSIONS

#### **Measurement Procedure**

The equipment under test is placed inside the semi-anechoic chamber on a wooden table at the turntable center. For each spurious frequency, the antenna mast is raised and lowered from 1 to 4 meters and the turntable is rotated 360 degrees to obtain a maximum reading on the spectrum analyzer. This is repeated for both horizontal and vertical polarizations of the receive antenna.

The equipment under test is then replaced with a substitution antenna fed by a signal generator. With the signal generator tuned to a particular spurious frequency, the antenna mast is raised and lowered from 1 to 4 meters to obtain a maximum reading at the spectrum analyzer. The output of the signal generator is then adjusted until a reading identical to that obtained with the actual transmitter is achieved.

The power in dBm of each spurious emission is calculated by correcting the signal generator level for cable loss and gain of the substitution antenna referenced to a dipole. A fully charged battery was used for the supply voltage.

The settings of the receiver were as follows:

Units dBm Divisions 5 dB

Detector Peak Detector

Resolution Bandwidth 1 MHz Video Bandwidth (AVG) Auto Sweep Time Auto

The margin with respect to the limit is the minimum margin for all modes and bands.

## FREQUENCY STABILITY

### **Measurement Procedure**

The equipment under test is placed in an environmental chamber. The antenna port of the Equipment Under Test is directly coupled to the input of the measurement equipment through a specialized RF connector. A power supply is attached as the primary voltage supply.

Frequency measurements are made at the extremes of the temperature range -30° C to +60° C and at intervals of 10° C with the primary supply voltage set to the nominal battery operating voltage. A period of time sufficient to stabilize all components of the equipment is allowed at each frequency measurement. The maximum variation of frequency is measured.

At room temperature, the primary supply voltage is reduced to the battery operating endpoint of the equipment under test. The maximum variation of frequency is measured. A battery eliminator was used for the input supply voltage.

#### FIELD STRENGTH OF EMISSIONS FROM UNINTENTIONAL RADIATORS

#### **Measurement Procedure**

The equipment under test is placed inside the semi-anechoic chamber on a wooden table at the turntable center. For each radiated emission, the antenna mast is raised and lowered from 1 to 4 meters and the turntable is rotated 360 degrees to obtain a maximum peak reading on the spectrum analyzer. The radiated emissions are then measured using an EMI receiver employing a CISPR quasi-peak detector function below 1000 MHz and an average detector function above 1000 MHz. This is repeated for both horizontal and vertical polarizations of the receive antenna. A fully charged battery was used for the supply voltage.

The field strength of each radiated emission is calculated by correcting the EMI receiver level for cable loss, amplifier gain, and antenna correction factors.

Field Strength (dBuV/m) = EMI Receiver Level (dBuV) + Cable Loss (dB) - Amplifier Gain <math>(dB) + Antenna Correction Factor (1/m)

### **Measurement Results**

### AC LINE CONDUCTED EMISSIONS

#### **Measurement Procedure**

Measured levels of ac power line conducted emission shall be the radio-noise voltage from the line probe or across the 50  $\Omega$  LISN port, where permitted, terminated into a 50  $\Omega$  noise meter, or where permitted or required, the radio-noise current on the power line sensed by a current probe.

All radio-noise voltage and current measurements shall be made on each current-carrying conductor at the plug end of the EUT power cord or calibrated extension cord by the use of mating plugs and receptacles on the EUT and LISN. Equipment shall be tested with power cords that are normally supplied using an LISN, the 50  $\Omega$  measuring port is terminated by a 50  $\Omega$  radio-noise meter or a 50  $\Omega$  resistive load. All other ports are terminated in 50  $\Omega$ .
