## Revisions

Revision 1 Issued April 2, 2018

## Foreword

The following information is submitted for consideration in obtaining Grant of Certification for License Exempt Digital Transmission System Intentional Radiator operating under Code of Federal Regulations Title 47 (47CFR) Paragraph 15.247 and Industry Canada RSS-GEN, Issue 4 and RSS-247 Issue 2, operation in the 2400 – 2483.5 MHz band.

Name of Applicant: Garmin International, Inc.  
1200 East 151st Street  
Olathe, KS 66062

M/N: A03405

FCC ID: IPH-03405 Industry Canada ID: 1792A-03405

Frequency Range: 2402-2480 MHz and 2412-2462 MHz

Power and OBW: ANT mode 1 power of 0.008 W, BT mode 2 power of 0.009 W, BLE mode 3 power of 0.007 W, (99% Occupied bandwidth ANT mode 1 - 958.5kHz, BT GFSK mode 2 - 960.0kHz, BLE GMSK mode 3 - 963.0kHz)  
mode 4 Average output power 802.11b 0.012 W, 802.11g 0.015 W, 802.11n 0.015 W, (99% Occupied bandwidth 802.11b - 14070, 802.11g – 17760, 802.11n - 18630 kHz)

## Opinion / Interpretation of Results

Tests Performed	Margin (dB)	Results
Emissions 15.205, RSS-GEN	-8.0	Complies
Emissions as per 47CFR paragraphs 2 and 15.207	-9.5	Complies
Emissions as per 47CFR paragraphs 2 and 15.209	-11.6	Complies
Harmonic Emissions per 47CFR 15.247	-8.0	Complies
Power Spectral Density per 47CFR 15.247	-10.9	Complies

## Equipment Tested

<u>Equipment</u>	<u>Model / PN</u>	<u>Serial Number</u>
EUT #1	A03405	4294 967235
EUT #2	A03405	4294 967295
USB Cable	320-01069-20	N/A
AC Adapter	362-00091-00	1702009359A3
Laptop Computer	Latitude E6320	FCN03Q1
USB Printer	Dell 0N5819	5D1SL61

Test results in this report relate only to the items tested.

## ***Equipment Function***

The EUT is a portable digital device. The device incorporates sensors to log movement and other physical functions and includes digital transmitters for communication with compatible equipment. The design offers no other interface options as described by the manufacture and presented below in the configuration diagrams. The low power transmitters provide operation capability in the 2402-2480 MHz frequency band and the Wi-Fi transmitter operates in the 2412-2462 MHz band. The design offers wireless communication in one of four modulation modes (mode 1 ANT, mode 2 BT GFSK, mode 3 BLE, and mode 4 802.11b,g,n) providing wireless interface with compatible equipment. The product operates from internal rechargeable battery only and offers no other provision for alternate power sources as documented. The design utilizes internal fixed antenna system and offers no provision for antenna replacement or modification. Two samples were provided for testing, one representative of production design, and the other modified for testing purposes replacing the integral antennas with 50-ohm RF connection port. The test samples were provided with test software enabling testing personnel ability to enable transmitter function on defined channels. The antenna modification offered testing facility the ability to connect test equipment to the temporary antenna port for antenna port conducted emission testing. The EUT was arranged as described by the manufacturer emulating typical user configurations for testing purposes. For testing purposes, the EUT received powered from freshly charged internal battery and/or external power and configured to operate in available modes. As requested by the manufacturer and required by regulations, the equipment was tested for emissions compliance using the available configurations with the worst-case data presented. The test software enabled extremely high duty cycles approaching 100% transmission for testing purposes. The production product will not operate at these high duty cycles. This report documents compliance testing and results for applicable product modes of operation. Test results in this report relate only to the products described in this report.

## Equipment Configuration

- 1) Unit operating off internal battery

- 2) Unit connected to (and powered by) AC adapter through USB cable (GPN: 320-01069-20)

- 3) Unit connected to Computer USB port through cable assembly (GPN: 320-01069-20)

- 4) Unit powered by internal battery transmitting ANT+/BLE/BT/Wi-Fi wireless data @ 2.4 GHz

## Application for Certification

- (1) Manufacturer: Garmin International, Inc.  
1200 East 151st Street  
Olathe, KS 66062
- (2) Identification: M/N: A03405  
FCC ID: IPH-03405 IC: 1792A-03405
- (3) Instruction Book:  
Refer to Exhibit for Instruction Manual.
- (4) Description of Circuit Functions:  
Refer to Exhibit of Operational Description.
- (5) Block Diagram with Frequencies:  
Refer to Exhibit of Operational Description.
- (6) Report of Measurements:  
Report of measurements follows in this Report.
- (7) Photographs: Construction, Component Placement, etc.:  
Refer to Exhibit for photographs of equipment.
- (8) List of Peripheral Equipment Necessary for operation. The equipment operates from direct current power provided from internal rechargeable battery. The design provides interface options with USB cable and compliant equipment as presented in this filing. The EUT offers no other connection ports than those presented in this filing.
- (9) Transition Provisions of CFR47 15.37 are not requested.
- (10) Not Applicable. The unit is not a scanning receiver.
- (11) Not Applicable. The EUT does not operate in the 59 – 64 GHz frequency band.
- (12) The equipment is not software defined and this section is not applicable.
- (13) Applications for certification of U-NII devices in the 5.15-5.35 GHz and the 5.47-5.85 GHz bands must include a high-level operational description of the security procedures that control the radio frequency operating parameters and ensure that unauthorized modifications cannot be made. This requirement is not applicable to his DTS device.
- (14) Contain at least one drawing or photograph showing the test set-up for each of the required types of tests applicable to the device for which certification is requested. These drawings or photographs must show enough detail to confirm other information contained in the test report. Any photographs used must be focused originals without glare or dark spots and must clearly show the test configuration used. This information is provided in this report and Test Setup Exhibits provided with the application filing.

## Applicable Standards & Test Procedures

The following information is submitted in accordance with the eCFR Federal Communications Code of Federal Regulations, dated January 31, 2018, Part 2, Subpart J, Paragraphs 2.907, 2.911, 2.913, 2.925, 2.926, 2.1031 through 2.1057, and applicable parts of paragraph 15, Part 15C Paragraph 15.247, and Industry Canada RSS-GEN Issue 4, and RSS-247 Issue 2. Test procedures used are the established Methods of Measurement of Radio-Noise Emissions as described in ANSI C63.10-2013.

## Testing Procedures

### ***AC Line Conducted Emission Test Procedure***

Testing for the AC line-conducted emissions was performed as required in 47CFR 15C, RSS-247 and specified in ANSI C63.10-2013. The test setup, including the EUT, was arranged in the test configurations as presented during testing. The test configuration was placed on a 1 x 1.5-meter bench, 0.8 meters high located in a screen room. The power lines of the system were isolated from the power source using a standard LISN with a 50- $\mu$ Hy choke. EMI was coupled to the spectrum analyzer through a 0.1  $\mu$ F capacitor internal to the LISN. The LISN was positioned on the floor beneath the wooden bench supporting the EUT. The power lines and cables were draped over the back edge of the table. Refer to diagram one showing typical test arrangement and photographs in exhibits for EUT placement used during testing.

### ***Radiated Emission Test Procedure***

Radiated emissions testing was performed as required in CFR47 15, RSS-247 and specified in ANSI C63.10-2013. The EUT was placed on a rotating 0.9 x 1.2-meter platform, elevated as required above the ground plane at a distance of 3 meters from the FSM antenna. EMI energy was maximized by equipment placement permitting orientation in three orthogonal axes, raising and lowering the FSM antenna, changing the antenna polarization, and by rotating the turntable. Each emission was maximized before data was taken using a spectrum analyzer. The frequency spectrum from 9 kHz to 25,000 MHz was searched for during preliminary investigation. Refer to diagrams two and three showing typical test arrangement and photographs in the test setup exhibits for specific EUT placement during testing.

1. Interconnecting cables that hang closer than 40 cm to the ground plane shall be folded back and forth in the center forming a bundle 30 cm to 40 cm long see (see 6.2.3.1).
2. I/O cables that are not connected to an accessory shall be bundled in the center. The end of the cable may be terminated, if required, using the correct terminating impedance. The overall length shall not exceed 1 m (see 6.2.2).
3. EUT connected to one LISN. Unused LISN measuring port connectors shall be terminated in 50  $\Omega$  loads. LISN can be placed on top of, or immediately beneath, reference ground plane (see 6.2.2 and 6.2.3).
  - 3.1 All other equipment powered from additional LISN(s).
  - 3.2 Multiple-outlet strip can be used for multiple power cords of non-EUT equipment.
  - 3.3 LISN at least 80 cm from nearest part of EUT chassis.
4. Non-EUT components of EUT system being tested.
5. Rear of EUT, including peripherals, shall all be aligned and flush with rear of tabletop (see 6.2.3.1).
6. Edge of tabletop shall be 40 cm removed from a vertical conducting plane that is bonded to the ground plane (see 6.2.2 for options).
7. Antenna may be integral or detachable. If detachable, the antenna shall be attached for this test.

**Diagram 1 Test arrangement for Conducted emissions**

1. A LISN is optional for radiated measurements between 30 MHz to 1000 MHz, but not allowed for measurements below 30 MHz and above 1000 MHz. (See 6.4.3, 6.5.1, and 6.6.3.) If used, connect EUT to one LISN. Unused LISN measuring port connectors shall be terminated in 50Ω. LISN can be placed on top of, or immediately beneath, reference ground plane (see 6.2.2 and 6.2.3.1).
  - 1.1 LISN spaced at least 80 cm from nearest part of EUT chassis.
2. The EUT shall be placed in the center of the table to the extent possible. (See 6.2.3.1 and 6.3.4).
3. A vertical conducting plane, if used for conducted tests per 6.2.2, shall be removed for radiated emission tests.
4. Antenna may be integral or detachable, depending on the EUT.
5. Interconnecting cables that hang closer than 40 cm to the ground plane shall be folded back and forth in the center forming a bundle 30 cm to 40 cm long.

**Diagram 2 Test arrangement for radiated emissions of tabletop equipment**

AC Line Conducted Emissions (0.150 -30 MHz)

## Units of Measurements

Conducted EMI            Data is in dB $\mu$ V; dB referenced to one microvolt

Radiated EMI            Data is in dB $\mu$ V/m; dB/m referenced to one microvolt per meter

Sample Calculation:

RFS = Radiated Field Strength, FSM = Field Strength Measured

A.F. = Receive antenna factor, Gain = amplification gains and/or cable losses

RFS (dB $\mu$ V/m @ 3m) = FSM (dB $\mu$ V) + A.F. (dB) - Gain (dB)

## Environmental Conditions

Ambient Temperature        20.9° C

Relative Humidity            38%

Atmospheric Pressure        1011.9 mb

## Statement of Modifications and Deviations

No modifications to the EUT were required for the unit to demonstrate compliance with the CFR47 Part 15C, RSS-Gen, and RSS-247 emission requirements. There were no deviations to the specifications.

## Intentional Radiators

The following information is submitted in support demonstration of compliance with the requirements of CFR47, Subpart C, paragraph 15.247 and Industry Canada RSS-247 and RSS-Gen the following information is submitted.

## Antenna Requirements

The EUT incorporates integral antenna system and offers no provision for connection to alternate antenna system. The antenna connection point complies with the unique antenna connection requirements. There are no deviations or exceptions to the specification.

## Restricted Bands of Operation

Spurious emissions falling in the restricted frequency bands of operation were measured at the OATS. The EUT utilizes frequency, determining circuitry, which generates harmonics falling in the restricted bands. Emissions were investigated at the OATS, using appropriate antennas or pyramidal horns, amplification stages, and a spectrum analyzer. Peak and average amplitudes of frequencies above 1000 MHz were compared to the required limits with worst-case data presented below. Test procedures of ANSI C63.10-2013 were used during testing. No other significant emission was observed which fell into the restricted bands of operation. Computed emission values consider the received radiated field strength, receive antenna correction factor, amplifier gain stage, and test system cable losses.

**Table 1 Harmonic Radiated Emissions in Restricted Bands Data (ANT Worst-case)**

Frequency in MHz	Horizontal Peak (dB $\mu$ V/m)	Horizontal Quasi-Peak (dB $\mu$ V/m)	Horizontal Average (dB $\mu$ V/m)	Vertical Peak (dB $\mu$ V/m)	Vertical Quasi-Peak (dB $\mu$ V/m)	Vertical Average (dB $\mu$ V/m)	Limit @ 3m (dB $\mu$ V/m)

**Summary of Results for Radiated Emissions in Restricted Bands**

The EUT demonstrated compliance with the radiated emissions requirements of 47CFR Part 15C RSS-Gen, and RSS-247 Intentional Radiators. The EUT worst-case ANT mode 1 demonstrated a minimum radiated emission margin of -10.9 dB below the requirements in restricted frequency bands. The EUT worst-case BT mode 2 demonstrated a minimum radiated emission margin of -8.1 dB below the requirements in restricted frequency bands. The EUT worst-case BLE mode 3 demonstrated a minimum radiated emission margin of -8.0 dB below the requirements in restricted frequency bands. The EUT worst-case 802.11 mode 4 demonstrated a minimum radiated emission margin of -16.9 dB below the requirements in restricted frequency bands. Peak, Quasi-peak, and average amplitudes were checked for compliance with the regulations. Worst-case emissions are reported with other emissions found in the restricted frequency bands at least 20 dB below the requirements.

## **AC Line Conducted Emissions Procedure**

The EUT was arranged in typical equipment configurations operating from AC power adapter. Testing was performed with the EUT placed on a 1 x 1.5-meter wooden bench 80 cm above the conducting ground plane, floor of a screen room. The bench was positioned 40 cm away from the wall of the screen room. The LISN was positioned on the floor of the screen room 80-cm from the rear of the EUT. Testing for the line-conducted emissions were the procedures of ANSI C63.10-2013 paragraph 6. The AC adapter for the EUT was connected to the LISN for line-conducted emissions testing. A second LISN was positioned on the floor of the screen room 80-cm from the rear of the supporting equipment of the EUT. All power cords except the EUT were then powered from the second LISN. EMI was coupled to the spectrum analyzer through a 0.1  $\mu$ F capacitor, internal to the LISN. Power line conducted emissions testing was carried out individually for each current carrying conductor of the EUT. The excess length of lead between the system and the LISN receptacle was folded back and forth to form a bundle not exceeding 40 cm in length. The screen room, conducting ground plane, analyzer, and LISN were bonded together to the protective earth ground. Preliminary testing was performed to identify the frequencies of each of the emissions, which demonstrated the highest amplitudes. The cables were repositioned to obtain maximum amplitude of measured EMI level. Once the worst-case configuration was identified, plots were made of the EMI from 0.15 MHz to 30 MHz then data was recorded with maximum conducted emissions levels.

Refer to figures one and two showing plots of the AC adapter option and figures three and four for plots of the computer configuration line conducted emissions.

plots of the computer configuration line conducted emissions.

Other emissions present had amplitudes at least 20 dB below the limit.

**Summary of Results for AC Line Conducted Emissions Results**

The EUT demonstrated compliance with the AC Line Conducted Emissions requirements of 47CFR Part 15B and other applicable emissions requirements. The worst-case EUT AC adapter configuration #2 demonstrated a minimum margin of -12.3 dB below the FCC/IC requirements. The worst-case EUT CPU configuration demonstrated a minimum margin of -9.5 dB below the FCC/IC requirements. Other emissions were present with amplitudes at least 20 dB below the limit and worst-case amplitudes recorded.

### General Radiated Emissions Procedure

The EUT was arranged in a typical equipment configuration and operated through all available mode during testing. Preliminary testing was performed in a screen room with the EUT positioned 1 meter from the FSM. Radiated emissions measurements were performed to identify the frequencies, which produced the highest emissions. Each radiated emission was then maximized at the OATS location before final radiated measurements were performed. Final data was taken with the EUT located on the OATS at 3 meters distance between the EUT and the receiving antenna. The frequency spectrum from 9 kHz to 25,000 MHz was searched for general radiated emissions. Measured emission levels were maximized by EUT placement on the table, rotating the turntable through 360 degrees, varying the antenna height between 1 and 4 meters above the ground plane and changing antenna position between horizontal and vertical polarization. Antennas used were Loop from 9 kHz to 30 MHz, Broadband Biconical from 30 to 200 MHz, Biconilog from 30 to 1000 MHz, Log Periodic from 200 MHz to 1 GHz and or double Ridge or pyramidal horns and mixers above 1 GHz, notch filters and appropriate amplifiers and external mixers were utilized.

**Table 9 General Radiated Emissions Data**

Frequency in MHz	Horizontal Peak (dBµV/m)	Horizontal Quasi-Peak (dBµV/m)	Horizontal Average (dBµV/m)	Vertical Peak (dBµV/m)	Vertical Quasi-Peak (dBµV/m)	Vertical Average (dBµV/m)	Limit @ 3m (dBµV/m)
52.9	31.6	24.8	N/A	35.1	28.4	N/A	40.0
55.4	30.1	23.9	N/A	32.7	26.3	N/A	40.0

120.0	30.3	24.8	N/A	29.6	23.6	N/A	40.0
150.0	34.3	20.0	N/A	31.8	21.5	N/A	40.0
167.0	26.0	15.8	N/A	27.4	19.6	N/A	40.0

Other emissions present had amplitudes at least 20 dB below the limit. Peak and Quasi-Peak amplitude emissions are recorded for frequency range below 1000 MHz. Peak and Average amplitude emissions are recorded for frequency range above 1000 MHz.

## **Summary of Results for General Radiated Emissions**

The EUT demonstrated compliance with the radiated emissions requirements of CFR47 Part 15C paragraph 15.209, RSS-247 and RSS-GEN Intentional Radiators. The EUT demonstrated a minimum margin of -11.6 dB below the requirements. Other emissions were present with amplitudes at least 20 dB below the Limits.

### **Operation in the Band 2400 – 2483.5 MHz**

Test procedures of ANSI C63.10-2013 paragraph 6, and KDB 558074 v04 were used during transmitter testing. The peak output power of modes 1 through 3 were measured at the antenna port using a spectrum analyzer as described in KDB 558074 (9.1.1). The mode 4 wideband transmitter average power was measured at the antenna port using a wideband RF power meter as described in KDB 558074 (9.2.3). The peak Power Spectral Density (PKPSD) of all modes were measured as defined in KDB 558074 (10.2). DTS Emission bandwidth was measured as described in KDB 558074 paragraph 8, and C63.10-2013. The amplitude of each harmonic and general radiated emission was measured on the OATS at distance of 3 meters from the FSM antenna (testing was performed on sample 1 representative of production equipment with integral antenna). The EUT was positioned on supporting turntable elevated as required above the ground plane, at a distance of 3 meters from the FSM antenna. Radiated emission investigations were performed from 9 kHz to 25,000 MHz. Each radiated emission was maximized by varying the FSM antenna height and polarization, and by rotating the turntable. The worst-case amplitude of each emission was then recorded from the analyzer display. The peak and quasi-peak amplitude of frequencies below 1000 MHz were measured using a spectrum analyzer. The peak and average amplitude of frequencies above 1000 MHz were measured using a spectrum analyzer. A Loop antenna was used for measuring emissions from 0.009 to 30 MHz, Biconilog Antenna for 30 to 1000 MHz, Double-Ridge, and/or Pyramidal Horn Antennas from 1 GHz to 25 GHz. Radiated Emissions were measured in dB $\mu$ V/m @ 3 meters. Test sample #2 was provided for testing antenna port conducted emissions. This sample was modified by replacing the internal antenna with a 50-ohm antenna port connector for testing purposes. Plots were taken of transmitter performance (using sample #2) for reference in this and other documentation.

## **Summary of Results for Transmitter Radiated Emissions of Intentional Radiator**

The EUT demonstrated compliance with the radiated and conducted emission requirements of 47CFR Part 15.247, RSS-GEN, and RSS-247 Digital Transmission Systems. ANT - mode 1 Peak output power of 0.008 Watts was measured. BT GFSK - mode 2 Peak output power of 0.009 Watts was measured. BLE GMSK - mode 3 Peak output power of 0.007 Watts was measured. 802.11b - mode 4 average output power of 0.012 Watts was measured. 802.11g - mode 4 average output power of 0.015 Watts was measured. 802.11n - mode 4 average output power of 0.015 Watts was measured. The peak power spectral density measured at the antenna port presented a minimum margin of; ANT mode 1 provided -11.0 dB, BT GFSK mode 2 provided -10.9 dB, BLE GMSK - mode 3 provided -11.2 dB, 802.11b mode 4 provided -21.9 dB, 802.11g mode 4 provided -21.7 dB, and 802.11n mode 4 provided -21.9 dB below the requirements. The EUT demonstrated a minimum margin of -8.0 below the harmonic emissions requirements. There were no other significantly measurable emissions in the restricted bands other than those recorded in this report. Other emissions were present with amplitudes at least 20 dB below the requirements. There were no other deviations or exceptions to the requirements.

## Annex

- Annex A Measurement Uncertainty Calculations
- Annex B Rogers Labs Test Equipment List
- Annex C Rogers Qualifications
- Annex D Rogers Labs Certificate of Accreditation

## Annex A Measurement Uncertainty Calculations

Measurement uncertainty calculations were made for the laboratory. Result of measurement uncertainty calculations are recorded below for AC line conducted and radiated emission measurements.

Measurement Uncertainty	$U_{(E)}$	$U_{(lab)}$
3 Meter Horizontal 30-200 MHz Measurements	2.08	4.16
3 Meter Vertical 30-200 MHz Measurements	2.16	4.33
3 Meter Vertical Measurements 200-1000 MHz	2.99	5.97
10 Meter Horizontal Measurements 30-200 MHz	2.07	4.15
10 Meter Vertical Measurements 30-200 MHz	2.06	4.13
10 Meter Horizontal Measurements 200-1000 MHz	2.32	4.64
10 Meter Vertical Measurements 200-1000 MHz	2.33	4.66
3 Meter Measurements 1-6 GHz	2.57	5.14
3 Meter Measurements 6-18 GHz	2.58	5.16
AC Line Conducted	1.72	3.43

## Annex B Rogers Labs Test Equipment List

## **Annex C Rogers Qualifications**

***Scot D. Rogers, Engineer***

### **Rogers Labs, Inc.**

Mr. Rogers has approximately 17 years' experience in the field of electronics. Engineering experience includes six years in the automated controls industry and remaining years working with the design, development and testing of radio communications and electronic equipment.

#### Positions Held

Systems Engineer: A/C Controls Mfg. Co., Inc. 6 Years

Electrical Engineer: Rogers Consulting Labs, Inc. 5 Years

Electrical Engineer: Rogers Labs, Inc. Current

#### Educational Background

- 1) Bachelor of Science Degree in Electrical Engineering from Kansas State University.
- 2) Bachelor of Science Degree in Business Administration Kansas State University.
- 3) Several Specialized Training courses and seminars pertaining to Microprocessors and Software programming.

Scot D. Rogers

## Annex D Rogers Labs Certificate of Accreditation

<p>United States Department of Commerce National Institute of Standards and Technology</p>  <hr/> <p><b>Certificate of Accreditation to ISO/IEC 17025:2005</b></p> <hr/> <p>NVLAP LAB CODE: 200087-0</p> <p><b>Rogers Labs, Inc.</b> Louisburg, KS</p> <p><i>is accredited by the National Voluntary Laboratory Accreditation Program for specific services, listed on the Scope of Accreditation, for:</i></p> <p><b>Electromagnetic Compatibility &amp; Telecommunications</b></p> <p><i>This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2005. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communique dated January 2009).</i></p> <hr/> <table border="0" style="width: 100%;"><tr><td style="width: 33%; text-align: center;"><p>2017-03-01 through 2018-03-31 <i>Effective Dates</i></p></td><td style="width: 33%; text-align: center;"></td><td style="width: 33%; text-align: center;"> <i>For the National Voluntary Laboratory Accreditation Program</i></td></tr></table>			<p>2017-03-01 through 2018-03-31 <i>Effective Dates</i></p>		 <i>For the National Voluntary Laboratory Accreditation Program</i>
