

A. INTRODUCTION

The following data are submitted in connection with this request for type certification of the ATW-T101 transmitter in accordance with Part 2, Subpart J of the FCC Rules.

The ATW-T101 is a 5 milliwatt, UHF, frequency modulated battery operated transmitter configured as a belt-pack for wireless microphone applications under Part 74.

B. GENERAL INFORMATION REQUIRED FOR TYPE CERTIFICATION
(Paragraph 2.983 of the Rules)

1. Name of applicant: Audio-Technica
2. Identification of equipment: FCC ID: JFZT101
 - a. The equipment identification label is shown in Appendix 1.
 - b. Photographs of the equipment are included in Appendix 2.
3. Quantity production is planned.
4. Technical description:
 - a. Emission 80k0F3E
 - b. Frequency range: 728 - 741 MHz.
 - c. Operating power of transmitter is fixed at the factory at 5 mW.
 - d. Maximum power permitted under Part 74.861(e) (1)(ii) of the rules is 250 milliwatts, and the ATW-T101 complied with those power limitations.
 - e. The dc voltage and dc currents at final amplifier:

Collector voltage: 8.8 Vdc
Collector current: 1.1 mA
 - f. Function of each active semiconductor device:
See Appendix 3.
 - g. Complete circuit diagram is included in Appendix 4.
 - h. A draft instruction book is submitted as Appendix 5.
 - i. The transmitter tune-up procedure is included in Appendix 6.
 - j. A description of circuits for stabilizing frequency is included in Appendix 7.
 - k. A description of circuits and devices employed for suppression of spurious radiation and for limiting modulation is included in Appendix 8.
 - l. Not applicable.

B. GENERAL INFORMATION REQUIRED FOR TYPE CERTIFICATION (cont'd)

5. Data for 2.985 through 2.997 follow this section.

6. RF Power Output (Paragraph 2.987(a) of the Rules)

Output power, was computed using maximum measured field intensity @ 3m as 5 mW. (See Table 1 for sample computation.)

NOTE: All audio measurements were made hard-wired using the normal input connector.

C. MODULATION CHARACTERISTICS

1. A curve showing frequency response of the transmitter is shown in Figure 1. Reference level was a 1 kHz audio signal at 10 kHz deviation. A Boonton 8220 modulation meter was used to measure deviation. Audio output was measured from an Audio Precision System One integrated measurement system.

2. Under Section 74.861 no modulation limiting is required.

3. Occupied Bandwidth
(Paragraphs 2.989(c), and 74.861(6) of the Rules)

Figure 2 is a plot of the sideband envelope of the transmitter taken with a Tektronix 494P spectrum analyzer. Modulation consisted of a 12.5 kHz tone, the frequency of maximum response, at an input level 16 dB greater than that necessary to produce 50% modulation.

NOTE: As a wireless microphone, audio bandwidth is 15 kHz, and maximum system deviation is 25 kHz. Using $2D+2F$ = modulation factor. Where "D" is rated system deviation, and "F" is maximum modulation frequency, an emission designator of 80k0F3E was computed.

C. MODULATION CHARACTERISTICS (Continued)

The plots are within the limits imposed by paragraph 74.861(6). The horizontal scale (frequency is 50 kHz per division) and the vertical scale (amplitude) is a logarithmic presentation equal to 10 dB per division.

D. SPURIOUS EMISSIONS AT THE ANTENNA TERMINALS
(Paragraph 2.991 of the Rules)

The ATW-T101 transmitter has no provisions for external antenna connections. Accordingly, only radiated emissions were measured.

E. FIELD STRENGTH MEASUREMENTS OF SPURIOUS RADIATION
(Paragraph 2.993(a) (b) (2) of the Rules)

Field intensity measurements of radiated spurious emissions from the ATW-T101 were made with a Tektronix 494P spectrum analyzer using Singer DM-105A dipoles or Polarad CA-L, CA-S and EMCO 3115 horn antennas. The transmitter was located in an open field 3 meters from the test antenna. Supply voltage was a fresh battery pack with a terminal voltage under load of 9.0 Vdc. The transmitter and test antennas were arranged to maximize pickup. Both vertical and horizontal test antenna polarization were employed. (The radiation test range is currently listed as an accepted site.)

Since the transmitter is used only with an integral antenna and has no provisions for connection of an external antenna, reference level for spurious emissions was taken as maximum measured emission at the operational frequency. A nominal 1 meter microphone cable was attached during the test.

The measurement system was capable of detecting signals 100 dB or more below the reference level. Measurements were made from the lowest frequency generated within the unit, or 4 MHz, to 10 times operating frequency. Data after application of antenna factors and line loss corrections are shown in Table 1.

TABLE 1

TRANSMITTER RADIATED SPURIOUS
728.125 MHz; 9 Vdc; 5 mW

<u>Emission Frequency</u> <u>MHz</u>	<u>Field</u> <u>Intensity</u> <u>uV/m@3m</u>	<u>dB Below</u> <u>Carrier Reference</u> ¹
728.126 (Carrier)	169824	0.0
1456.252	355	53.6
2184.378	776	46.8
2912.502	1000	44.6
3640.628	1274	42.5
4368.752	275	55.8
5096.882	102	64.4
5825.008	81	66.4
6553.134	91	65.4
7281.260	182	59.4

Required: $43+10\log(P) =$ 20

1. Worst-case polarization.

All other spurious from 6 MHz to the tenth harmonic were 20 dB or more below limit.

Power Computation:

$$E = \frac{(49.2P_t)^{1/2}}{3} \quad (1)$$

$$P = \frac{(3 \cdot E)^2}{49.2}$$

where

P = Power in watts

E = electric-field intensity in volts/meter

$$0.005 = (3 \cdot 169824 E^{-6})^2 / 49.2$$

F. FREQUENCY STABILITY
(Paragraph 2.995(2) and 90.213 of the Rules)

Measurement of frequency stability versus temperature was made at temperatures from -30°C to $+50^{\circ}\text{C}$. At each temperature, the unit was exposed to test chamber ambient a minimum of 60 minutes after indicated chamber temperature ambient had stabilized to within $\pm 2^{\circ}$ of the desired test temperature. Following the 1 hour soak at each temperature, the unit was turned on, keyed and frequency measured within 2 minutes. Test temperature was sequenced in the order shown in Table 2, starting with -30°C .

A Thermotron S1.2 temperature chamber was used. Temperature was monitored with a Keithley 871 digital temperature probe. The transmitter output stage was terminated in a 50 ohm dummy load. Primary supply was 9 volts. Frequency was measured with a HP5385A digital frequency counter connected to the transmitter through a power attenuator.

TABLE 2

FREQUENCY STABILITY AS A FUNCTION OF TEMPERATURE

728.125 MHz; 9 Vdc; 5 mW

<u>Temperature, $^{\circ}\text{C}$</u>	<u>Output Frequency, MHz</u>
-28.7	728.100082
-19.7	728.107856
- 9.6	728.114299
- 0.1	728.118692
10.2	728.121793
19.9	728.123993
30.2	728.125635
39.8	728.127029
49.6	728.128875
Maximum frequency error:	728.100082
	<u>728.125000</u>
	- .024918 MHz

FCC Rule 74.861(e)(4) specifies .005% or a maximum of ± 0.036406 MHz, corresponding to:

High Limit	728.161406 MHz
Low Limit	728.088594 MHz

G. FREQUENCY STABILITY AS A FUNCTION OF SUPPLY VOLTAGE
(Paragraph 2.995(d)(2) of the Rules)

Oscillator frequency as a function of power supply voltage was measured with a HP 5385A digital frequency counter as supply voltage provided by a HP 6264B variable dc power supply was varied $\pm 15\%$ from the nominal 9 volt rating. A Keithley 177 digital voltmeter was used to measure supply voltage at transmitter primary input terminals. Measurements were made at 20 °C ambient.

TABLE 3

FREQUENCY STABILITY AS A FUNCTION OF SUPPLY VOLTAGE

728.125 MHz; 9 Volt Nominal; 5 mW

<u>Supply Voltage</u>	<u>Output Frequency, MHz</u>
10.4	728.123938
9.9	728.123965
9.5	728.123989
9.0	728.123993
8.6	728.124011
8.1	728.124022
7.7	728.124022
6.5 * rated battery end-point	728.124020
Maximum frequency error:	728.123938
	<u>728.125000</u>
	- 0.001062

FCC Rule 74.861(e)(4) specifies .005% or a maximum of ± 0.036406 MHz, corresponding to:

High Limit	728.161406
Low Limit	728.088594
