Dear Mr. Monticello,

I am providing this statement to you in response to your request for information on the type of switches we plan to use on our 418 MHz transmitters.

The transmitters were designed strictly around momentary style switches. All of the intended field applications utilizing these transmitters require momentary operation of the individual control functions. At no time will PQ use latching style switches. While combining the momentary action of the switch functions with the self-power down feature of the transmitter itself, the design intends to ensure safe operation in all remote control applications.

Please contact Dave Schumann or I with further questions or comments.

Thank You,
