## 1.5 Measurement uncertainty

The treatment of uncertainty is based on the general matters on the definition of uncertainty in “Guide to the expression of uncertainty in measurement (GUM)” published by ISO. The Lab’s uncertainty is determined by referring UKAS Publication LAB34: 2002 “The Expression of Uncertainty in EMC Testing” and CISPR16-4-2: 2011 “Uncertainty in EMC Measurements”.

The uncertainty of the measurement result in the level of confidence of approximately 95% (k=2) is as follows;

Conducted emissions (10 kHz – 30 MHz):	± 3.7 dB
Radiated emissions (150 kHz - 30 MHz):	± 3.2 dB
Radiated emissions (30 MHz - 1000 MHz):	± 6.1 dB
Radiated emissions (1000 MHz - 2000 MHz):	± 4.4 dB
Electrostatic discharge:	Within the tolerance specified by the standard
Radiated disturbance:	±2.6 dB
Fast transients (bursts):	Within the tolerance specified by the standard
Conducted radio frequency disturbance:	± 1.3 dB
Slow transients (surges):	Within the tolerance specified by the standard

### 2.1 EMI requirement

#### 2.1.1 Radiated emissions

[Test setup]

Test setup is implemented according to the method of IEC 60945 "Radiated measurements".

This Test Report is issued by the Company under its General Conditions of Service printed overleaf or available on request and accessible at <http://www.sgs.com>. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Unless otherwise stated the results shown in this Test Report refer only to the sample(s) tested. This Test Report cannot be reproduced expert, in full, without prior approval of the Company. Any unauthorized alteration, forgery or falsification of the content or appearance of this test report is unlawful and offenders may be prosecuted to the fullest extent of the law.

この試験報告書は裏面に記載された、もしくは <http://www.sgs.com> で入手が可能なサービスに関する一般的条件に則して発行されます。そちらに明記されている弊社の負うべき債務・補償の範囲及び司法管轄の項目をご注意ください。他に特に明記のない限り、この試験報告書に記載された結果は、試験サンプルのみに属します。この書面全体の複製以外には、弊社からの事前の許可を得ること無く複製することを禁じます。この検査報告書を無断で変更、偽造、改ざんすることは違法であり、違反者に対しては法的手段を講じることになります。

[Test method]

The test method shall be in accordance with IEC 60945.

The ancillary equipment shall be tested under operational conditions typical for its normal use. If these conditions cannot be achieved without connection to the radio equipment, then the ancillary equipment shall be tested in combination with the radio equipment to the related requirements for the enclosure radiation in the relevant radio product standard for the effective use of the radio spectrum.

The EUT shall be placed on a non-conductive support with a height of 1.5 m. The measuring distance between the centre of the test antenna and the EUT shall be 3 m. A test site in accordance with IEC 60945 and CISPR 16-1-1 shall be used.

The measuring bandwidth shall be in accordance with a table below.

Table: Measuring bandwidth for radiated emissions

Frequency Range	Measuring bandwidth
30 MHz to 2 GHz	120 kHz
156 MHz to 165 MHz	9 kHz
150 kHz to 30 MHz	9 kHz

The setting of controls which may affect the level of radiated interference shall be varied in order to ascertain the maximum emission level.

When the EUT consists of more than one unit the interconnecting cables shall have the maximum length and type as indicated by the manufacturer. Available input and output ports of the ancillary equipment under test shall be connected to the maximum length of cable as indicated by the manufacturer and terminated to simulate the impedance of the relevant ports of the radio equipment. These cables shall be bundled at the approximate centre of the cable with the bundles of 30 cm to 40 cm in length running in the horizontal plane from the port to which it is connected. If it is impractical to do so because of cable bulk or stiffness, the disposition of the excess cable shall be precisely noted in the test report.

The emissions shall be measured in the frequency range of 150 kHz to 2 GHz in accordance with CISPR 16-1-1 using the measuring receiver or a comparable spectrum analyzer. During the measurements up to 2 GHz the quasi-peak detector shall be used.

In addition, for the frequency band 156 MHz to 165 MHz, the measurement shall be repeated with a receiver bandwidth of 9 kHz to 10 kHz. The equipment shall meet both, the quasi peak and the peak emission limits set out in table below.

[Limits]

The levels of field strength of any radiated emission from the enclosure of the EUT in the frequency range 150 kHz to 2 GHz shall not exceed the values given in table below.

Table: EMC emission limits

Frequency range	Limit (QP) [dB $\mu$ V/m]	Limit (PK) [dB $\mu$ V/m]	Measuring distance
150 kHz - 300 kHz	80 - 52	-	3 m
300 kHz - 30 MHz	52 - 34	-	3 m
30 MHz - 1 GHz	54	-	3 m
1 GHz - 2 GHz	54	-	3 m
156 MHz - 165 MHz	24	30	3 m

## 2.1.2 Conducted emissions

### [Test Method]

The test method shall be in accordance with IEC 60945.

This test shall be performed on a representative configuration of the EUT in both, the receive and the transmit mode of operation, as appropriate.

The power input cable between DC input ports of the EUT and the Artificial Mains Network (AMN) shall be screened and not exceed 0.8 m in length.

If the EUT consists of more than one unit with individual DC power input ports, power input ports of identical nominal supply voltages shall be connected in parallel to the artificial mains network.

The setting of controls which may affect the level of conducted interference shall be varied in order to ascertain the maximum emission level.

The measuring bandwidth shall be:

- 200 Hz in the frequency range 10 kHz to 150 kHz
- 9 kHz in the frequency range 150 kHz to 30 MHz.

The measurement frequency range extends from 10 kHz to 30 MHz. When the EUT is a transmitter operating at frequencies below 30 MHz, then the exclusion band for transmitters applies (see clause 4.3) for measurements in the transmit mode of operation.

Test setup is implemented according to the method of IEC 60945 "Conducted measurements".

This Test Report is issued by the Company under its General Conditions of Service printed overleaf or available on request and accessible at <http://www.sgs.com>. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Note: All emissions have more than 20 dB margin.

The power line conducted emission voltage is calculated by adding the LISN factor and the cable loss attenuation from the measured reading. The calculation is as follows:

$$\text{Result} = \text{Reading} + C. F$$

where            C.F = LISN Factor + Cable Loss + Gain [dB]
