### Introduction

DoorKing's one, two and three button MicroClik™ are small, light-weight RF transmitter devices. When activated by pressing one of the buttons, it will trigger the remote SuperHet™ receiver programmed to recognize the transmitter and button pressed. These transmitters incorporate a facility and transmitter code that is proprietary to DoorKing, and provides over one million transmitter code combinations. Each transmitter is programmed at the factory to one in a million codes. These transmitters will retain their pre-programmed code even with a low, or no battery. The DoorKing MicroClik™ transmitters and SuperHet™ receivers are an ideal combination for applications that require wireless access control.
