

## **INTERTEK TESTING SERVICES**

---

### **Purpose of Application**

The purpose of this application is to report changes in the previous certified product for product reason. The main modification is removing Caller ID feature, LCD display on handset, and a Page Key PCB with melody ringer function on base unit. The RF modules of the base unit and the handset are identical in, construction, dimensions, and electrical circuits except the change of TX dielectric filter to LC filter. With this change, minor PCB change has been made to include both dielectric filter and LC filters as optional parts. Also, some components locations were adjusted for process improvement. The above changes don't intend for maximum power and don't change on field strength ratings. All other design including electronic, electrical, mechanical design, PCB design and cosmetics remain the same.
