6 EUT description

6.1 General information

The EUT, Digital Multi-Band Mini Repeater (DIGImini repeater), is an innovative and flexible multiband coverage solution optimized for in-building applications which offers a range of possibilities.

With multi band technology applications, multiple filters are required in the operation bands. The DIGImini is designed to provide high performance digital filters with a price competitive to legacy analog mini repeaters.

The DIGImini is connected to two antennas, a donor antenna placed on the roof of the building and a radiating coaxial cable or antennas in the area to be covered. A state-of-the-art Interference Mitigation and Oscillation Prevention (IMOP) algorithm is used to monitor the isolation between the antennas and should oscillation be present the gain is adjusted immediately to prevent it. The device is powered via 120 VAC/12 VDC adapter, model VEH90PS12.

7.2.2 Test procedure

- 7.2.2.1 The EUT was set up as shown in Figure 7.2.1, energized and its proper operation was checked.
- 7.2.2.2 The signal generator power was adjusted to a level just below the AGC threshold but not more than 0.5 dB below.
- 7.2.2.3 The mean output power was measured with the spectrum analyzer as provided in the associated tables and plots.
- 7.2.2.4 The corresponding input power was measured with the same settings of the spectrum analyzer.
- 7.2.2.5 The above measurements were repeated with input signal adjusted to be 3 dB above the AGC threshold.
- 7.2.2.6 The EUT gain was calculated as a difference between output and input signal levels.
- 7.2.2.7 The test results provided in the associated tables.

7.3 Out-of-band rejection test

7.3.1 General

This test was performed to measure amplifier pass bandwidth. Specification test limits are given in Table 7.3.1.

Table 7.3.1 Out-of-band rejection limits

Assigned frequency range, MHz	Tested frequency range	Modulation envelope reference points*, dBc	Maximum allowed Gain versus frequency response, dB
2110.0 – 2180.0 1710.0 – 1780.0	$F_0 \pm 250\% BW$	20	≤ 1 dB nominal gain
728.0 – 746.0 698.0 – 716.0	$F_0 \pm 250\% BW$	20	≤ 1 dB nominal gain

* - Modulation envelope reference points are provided in terms of attenuation below the unmodulated carrier.

7.3.2 Test procedure

- 7.3.2.1 The EUT was set up as shown in The tested frequency range was swept with the signal generator and the amplifier 20 dB bandwidth was measured with spectrum analyzer as a frequency delta between the reference points on power envelope and provided in Table 7.3.2, Table 7.3.3 and the associated plots.
- 7.3.2.2 Figure 7.3.1, energized and its proper operation was checked.
- 7.3.2.3 The EUT was set to amplify the unmodulated carrier and the reference peak power level was measured.
- 7.3.2.4 The EUT was set to transmit the normally modulated carrier.
- 7.3.2.5 The tested frequency range was swept with the signal generator and the amplifier 20 dB bandwidth was measured with spectrum analyzer as a frequency delta between the reference points on power envelope and provided in Table 7.3.2, Table 7.3.3 and the associated plots.

7.4.2 Test procedure

- 7.4.2.1 The EUT was set up as shown in Figure 7.4.1 The tested frequency range was swept with the signal generator and the amplifier 20 dB bandwidth was measured with spectrum analyzer as a frequency delta between the reference points on power envelope and provided in Table 7.3.2, Table 7.3.3 and the associated plots.
- 7.4.2.2 Figure 7.3.1, energized and its proper operation was checked.
- 7.4.2.3 The EUT was set to transmit the normally modulated carrier.
- 7.4.2.4 The transmitter occupied bandwidth was measured with spectrum analyzer as a frequency delta between the reference points on modulation envelope and provided in the associated tables and plots.

7.5 Out-of-band emission conducted test

7.5.1 General

This test was performed to measure out-of-band spurious emissions at the channel edge at the RF antenna connector. Specification test limits are given in Table 7.5.1.

Table 7.5.1 Out-of-band emission limits

Frequency range, MHz	Attenuation below carrier, dBc	Out-of-band emission limit, dBm/100kHz
AWS-1 and AWS-3 frequency band		
2110.0 – 2180.0	43+10logP**	-13.0
1710.0 – 1780.0		
LTE700L frequency band		
728.0 – 746.0	43+10logP**	-13.0
698.0 – 716.0		

7.5.2 Test procedure

- 7.5.2.1 The EUT was set up as shown in Figure 7.5.1, energized and its proper operation was checked.
- 7.5.2.1 Signal generator A was configured for CW operation at the f0 frequency of appropriate frequency band,
- 7.5.2.2 Signal generator B was configured for CW operation tuned available channel spacing (e.g. 25, 12.5 or 6.25 kHz) above the frequency f0 or below the frequency f0 of the same frequency band.
- 7.5.2.3 The generator amplitudes were set so that the power from each into RF combiner was equivalent.
- 7.5.2.4 The signal generator's amplitudes were increased equally until just below the EUT's AGC threshold level was reached and all intermodulation products were measured.
- 7.5.2.5 Signal generator B was varied in frequency to check if intermodulation products were produced.
- 7.5.2.6 The intermodulation products were measured with spectrum analyzer as provided in the associated plots.
- 7.5.2.7 The EUT was tested with the composite input power level set to 3 dB above the AGC threshold level to show AGC operation, worst case results taken.
- 7.5.2.8 The test was repeated for all uplink and downlink operational bands. The test results are provided in the associated tables and plots.

7.6 Spurious emissions at RF antenna connector test

7.6.1 General

This test was performed to measure spurious emissions at RF antenna connector. Specification test limits are given in Table 7.6.1.

Table 7.6.1 Spurious emission limits

Frequency, MHz	Attenuation below carrier, dBc	ERP of spurious, dBm
0.009 – 10th harmonic*	$43 + 10\log P^{**}$	-13.0

* - spurious emission limits do not apply to the in band emission within ± 250 % of the authorized bandwidth from the carrier; investigated in course of emission mask testing

** - P is transmitter output power in Watts

7.6.2 Test procedure

7.6.2.1 The EUT was set up as shown in Figure 7.6.1, energized and its proper operation was checked.

7.6.2.2 The EUT was adjusted to produce maximum available for end user RF output power.

7.6.2.3 The spurious emission was measured with spectrum analyzer as provided in Table 7.6.2, Table 7.6.3 and associated plots.

7.7 Radiated spurious emission measurements

7.7.1 General

This test was performed to measure radiated spurious emissions from the EUT. Specification test limits are given in Table 7.7.1.

Table 7.7.1 Radiated spurious emission test limits

Frequency, MHz	Attenuation below carrier, dBc	ERP of spurious, dBm	Equivalent field strength limit @ 3m, dB(μV/m)***
0.009 – 10 th harmonic*	43+10logP**	-13	84.4

* - Excluding the in band emission within ± 250 % of the authorized bandwidth from the carrier

** - P is transmitter output power in Watts

*** - Equivalent field strength limit was calculated from maximum allowed ERP of spurious as follows:
 $E = \sqrt{30 \times P \times 1.64} / r$, where P is ERP in Watts, 1.64 is numeric gain of ideal dipole and r is antenna to EUT distance in meters

7.7.2 Test procedure for spurious emission field strength measurements in 9 kHz to 30 MHz band

7.7.2.1 The EUT was set up as shown in Figure 7.7.1, energized and the performance check was conducted.

7.7.2.2 The specified frequency range was investigated with antenna connected to spectrum analyzer. To find maximum radiation the turntable was rotated 360° and the measuring antenna was rotated around its vertical axis.

7.7.2.3 The worst test results (the lowest margins) were recorded in Table 7.7.2 and shown in the associated plots.

7.7.3 Test procedure for spurious emission field strength measurements above 30 MHz

7.7.3.1 The EUT was set up as shown in Figure 7.7.2, energized and the performance check was conducted.

7.7.3.2 The specified frequency range was investigated with antenna connected to spectrum analyzer. To find maximum radiation the turntable was rotated 360° and the measuring antenna height was swept from 1 to 4 m in both, vertical and horizontal, polarizations.

7.7.3.3 The worst test results (the lowest margins) were recorded in Table 7.7.2 and shown in the associated plots.

Hermon Laboratories is accredited by A2LA for calibration according to present requirements of ISO/IEC 17025 and NCSL Z540-1. The accreditation is granted to perform calibration of parameters that are listed in the Scope of Hermon Laboratories Accreditation.

Hermon Laboratories calibrates its reference and transfer standards by calibration laboratories accredited to ISO/IEC 17025 by a mutually recognized Accreditation Body or by a recognized national metrology institute. All reference and transfer standards used in the calibration system are traceable to national or international standards.

In-house calibration of all test and measurement equipment is performed on a regular basis according to Hermon Laboratories calibration procedures, manufacturer calibration/verification procedures or procedures defined in the relevant standards. The Hermon Laboratories test and measurement equipment is calibrated within the tolerances specified by the manufacturers and/or by the relevant standards.
