Dear Steve,

Question #1: Please explain how 3 test configurations are selected?

Response1: The selection of SAR test configurations were according to the typical holster supplied to the intended application. Please refer to the typical end-product user manual available at <https://partners.psc.com/marketlit/Send.aspx?file=R44-2489A>. And according to the supplied holsters and softcases, the tested configurations do represent the typical usage configurations.

Thank you for your kind assistance.

Regards,
