

**Environmental evaluation and exposure limit according to FCC CFR 47part 1,  
§1.1307, §1.1310**

The transceiver is classified as fixed, the calculation was done to confirm a safe distance.

Limit for power density for general population/uncontrolled exposure is 1 mW/cm<sup>2</sup> for 1500 -100000 MHz frequency range.

The power density **P (mW/cm<sup>2</sup>)** =  $P_T / 4\pi r^2$ , where

$P_T$  is the transmitted power, which is equal to the peak transmitter output power plus maximum antenna gain. The maximum equivalent isotropically radiated power EIRP is

$$P_T = 33.61 \text{ dBm} + 12.5 \text{ dBi} = 46.11 \text{ dBm} = 40832 \text{ mW, where}$$

33.61 dBm is the EUT maximum rated power,  
12.5 dBi – antenna gain.

The minimum safe distance “r”, where RF exposure does not exceed FCC permissible limit, is

$$r = \sqrt{P_T / (P \times 4\pi)} = \sqrt{40832 / 12.56} = 57 \text{ cm,}$$

which is less than calculated value in the original application.

A warning about a safe distance is contained in the user manual.
