

RE: FCC ID: OW3RM-67_ATCB002878

Attention: Guido Paland

1. Please remove the shields from the circuitry in the internal photos and provide photos of the circuitry underneath.

[Answer: New document in Exhibit 9 was uploaded. Additional detail photos from board have been added. The document '831_Exhibit09_Internal_Photos_02.pdf' shall replace the document '831_Exhibit09_Internal_Photos_01.pdf'.](#)

2. FYI – Please note that as of Sept RSS210 Issue 6 has been released. This latest version uses Annex 8 for FHSS devices. Please consider referencing the correct annex number for FHSS devices under RSS210 issue 6.

[Answer: Acknowledged.](#)

3. Please note that the part 24 report does not appear to contain the antenna terminal spurious emissions required measurements of 2.1051. Please explain and/or please provide the required data.

[Answer: The device does not have an external antenna connector. Therefore the conducted emissions at antenna terminal were not measured.](#)

4. Please note the part 15B test report only shows the device in receive mode and it is not clear if the phone is transferring data between the computer and the phone. As the 15B report is for the computer peripheral application, the EUT must be tested in a computer peripheral mode and not as a receiver. Please confirm or provide data showing the phone is communicating with the PC during part 15B computer peripheral testing.

[Answer: There was basic signalling between the phone and the computer activated during the tests.](#)
