5 Measurements and results

For Part 24/22 we use the substitution method (TIA/EIA 603).

All measurements in this report are done in GSM mode. The device is able to transmit data in GPRS mode also.

But because the current measurements are performed in PEAK mode no other results from GPRS mode are possible.

The only different is the modulation average power, which is 3 dB higher (by using 2 timeslots in the Up-link).

All relevant tests have been repeated in 8-PSK Modulation if EDGE Mode is supported.

5.1 PART PCS 1900

5.1.1 RF Power Output

Reference

| | |
|------|-------------------------------|
| FCC: | CFR Part 24.232, 2.1046 |
| IC: | RSS 133, Issue 4, Section 4.3 |

Summary:

This paragraph contains both average/peak output power and EIRP measurements for the mobile station. In all cases, the peak output power is within the required mask (this mask is specified in the JTC standards, TIA PN3389 Vol. 1 Chap 7, and is no FCC requirement).

Method of Measurements:

The mobile was set up for the max. output power with pseudo random data modulation.

The power was measured with R&S Signal Analyzer FSIQ 26 (peak and average)

These measurements were done at 3 frequencies, 1850.2 MHz, 1880.0 MHz and 1909.8 MHz (bottom, middle and top of operational frequency range).

Limits:

| |
|---------------------------------|
| Nominal Peak Output Power (dBm) |
| +33 |

Test Results: Output Power (conducted) GMSK Mode

| Frequency (MHz) | Peak Output Power (dBm) | Average Output Power (dBm) |
|-------------------------|-------------------------|----------------------------|
| 1850.2 | 29.77 | 29.75 |
| 1880.0 | 29.19 | 29.16 |
| 1909.8 | 29.20 | 29.18 |
| Measurement uncertainty | ±0.5 dB | |

Test Results: Output Power (conducted) 8-PSK Mode

| Frequency (MHz) | Peak Output Power (dBm) | Average Output Power (dBm) |
|-------------------------|-------------------------|----------------------------|
| 1850.2 | 28.72 | 25.44 |
| 1880.0 | 28.83 | 25.62 |
| 1909.8 | 28.44 | 25.23 |
| Measurement uncertainty | ±0.5 dB | |

EIRP Measurements

Description:

This is the test for the maximum radiated power from the phone.

Rule Part 24.232(b) specifies that "Mobile/portable stations are limited to 2 watts e.i.r.p. peak power..." and 24.232(c) specifies that "Peak transmit power must be measured over any interval of continuous transmission using instrumentation calibrated in terms of an rms-equivalent voltage."

Measuring the EIRP of Spurious/Harmonic Emissions using Substitution Method

(a) The measurements were performed with full rf output power and modulation.

(b) Test was performed at listed 3m test site (listed with FCC, IC).

(c) The transmitter under test was placed at the specified height on a non-conducting turntable (80 cm height)

(d) The BICONILOG antenna (20 MHz to 1 GHz) or HORN antenna (1 GHz to 18 GHz) was used for measuring.

(e) Load an appropriate correction factors file in EMI Receiver for correcting the field strength reading level

Total Correction Factor recorded in the EMI Receiver = Cable Loss + Antenna Factor

$E \text{ (dBuV/m)} = \text{Reading (dBuV)} + \text{Total Correction Factor (dB/m)}$

(f) Set the EMI Receiver and #2 as follows:

Center Frequency: test frequency

Resolution BW: 100 kHz

Video BW: same

Detector Mode: positive

Average: off

Span: 3 x the signal bandwidth

(g) The test antenna was lowered or raised from 1 to 4 meters until the maximum signal level was detected.

(h) The transmitter was rotated through 360° about a vertical axis until a higher maximum signal was received.

(i) The test antenna was lowered or raised again from 1 to 4 meters until a maximum was obtained. This level was recorded.

(j) The recorded reading was corrected to the true field strength level by adding the antenna factor, cable loss and subtracting the pre-amplifier gain.

(k) The above steps were repeated with both transmitters' antenna and test receiving antenna placed in vertical and horizontal polarization. Both readings with the antennas placed in vertical and horizontal polarization shall be recorded.

(l) Repeat for all different test signal frequencies

Measuring the EIRP of Spurious/Harmonic Emissions using Substitution Method

(a) Set the EMI Receiver (for measuring E-Field) and Receiver #2 (for measuring EIRP) as follows:

- Center Frequency : equal to the signal source
- Resolution BW : 10 kHz
- Video BW : same
- Detector Mode : positive
- Average : off
- Span : 3 x the signal bandwidth

(b) Load an appropriate correction factors file in EMI Receiver for correcting the field strength reading level

Total Correction Factor recorded in the EMI Receiver = Cable Loss + Antenna Factor

$E \text{ (dBuV/m)} = \text{Reading (dBuV)} + \text{Total Correction Factor (dB/m)}$

(c) Select the frequency and E-field levels for ERP/EIRP measurements.

(d) Substitute the EUT by a signal generator and one of the following transmitting antennas (substitution antenna):

DIPOLE antenna for frequency from 30-1000 MHz or .HORN antenna for frequency above 1 GHz }.

(e) Mount the transmitting antenna at 1.5 meter high from the ground plane.

(f) Use one of the following antenna as a receiving antenna: .DIPOLE antenna for frequency from 30-1000 MHz or .HORN antenna for frequency above 1 GHz }.

(g) If the DIPOLE antenna is used, tune its elements to the frequency as specified in the calibration manual.

(h) Adjust both transmitting and receiving antenna in a VERTICAL polarization.

(i) Tune the EMI Receivers to the test frequency.

(j) Lower or raise the test antenna from 1 to 4 meters until the maximum signal level was detected.

(k) The transmitter was rotated through 360 o about a vertical axis until a higher maximum signal was received.

(l) Lower or raise the test antenna from 1 to 4 meters until the maximum signal level was detected.

(m) Adjust input signal to the substitution antenna until an equal or a known related level to that detected from the transmitter was obtained in the test receiver.

(n) Record the power level read from the Average Power Meter and calculate the ERP/EIRP as follows:

$$P = P1 - L1 = (P2 + L2) - L1 = P3 + A + L2 - L1$$

$$EIRP = P + G1 = P3 + L2 - L1 + A + G1$$

$$ERP = EIRP - 2.15 \text{ dB}$$

$$\text{Total Correction factor in EMI Receiver \# 2} = L2 - L1 + G1$$

Where: P: Actual RF Power fed into the substitution antenna port after corrected.

P1: Power output from the signal generator

P2: Power measured at attenuator A input

P3: Power reading on the Average Power Meter

EIRP: EIRP after correction

ERP: ERP after correction

(o) Adjust both transmitting and receiving antenna in a HORIZONTAL polarization, then repeat step (k) to (o)

(p) Repeat step (d) to (o) for different test frequency

(q) Repeat steps (c) to (j) with the substitution antenna oriented in horizontal polarization.

(r) Actual gain of the EUT's antenna is the difference of the measured EIRP and measured RF power at the RF port. Correct the antenna gain if necessary.

Limits:

| |
|---------------------------------|
| Nominal Peak Output Power (dBm) |
| +33 |

Test Results: Output Power (radiated) GMSK Mode

$EIRP = SG \text{ (dBm)} - \text{Cable Loss (dB)} + \text{Ant. gain (dB*i*)}$

5.1.2 Frequency Stability

Reference

| | |
|------|-------------------------------|
| FCC: | CFR Part 24.235, 2.1055 |
| IC: | RSS 133, Issue 4, Section 4.2 |

Method of Measurement:

In order to measure the carrier frequency under the condition of AFC lock, it is necessary to make measurements with the mobile station in a “call mode”. This is accomplished with the use of a R&S CMU 200 DIGITAL RADIOCOMMUNICATION TESTER..

1. Measure the carrier frequency at room temperature.
2. Subject the mobile station to overnight soak at -30 C.
3. With the mobile station, powered with Vnom, connected to the CMU 200 and in a simulated call on channel 661 (center channel), measure the carrier frequency. These measurements should be made within 2 minutes of powering up the mobile station, to prevent significant self warming.
4. Repeat the above measurements at 10 C increments from -30 C to +60 C. Allow at least 1 1/2 hours at each temperature, un-powered, before making measurements.
5. Re-measure carrier frequency at room temperature with Vnom. Vary supply voltage from Vmin to Vmax, in 12 steps re-measuring carrier frequency at each voltage. Pause at Vnom for 1 1/2 hours un-powered, to allow any self heating to stabilize, before continuing.
6. Subject the mobile station to overnight soak at +60 C.
7. With the mobile station, powered with Vnom, connected to the CMU 200 and in a simulated call on channel 661(center channel), measure the carrier frequency. These measurements should be made within 2 minutes of powering up the mobile station, to prevent significant self warming.
8. Repeat the above measurements at 10 C increments from +60 C to -30 C. Allow at least 1 1/2 hours at each temperature, un-powered, before making measurements.
9. At all temperature levels hold the temperature to +/- 0.5 C during the measurement procedure.

Measurement Limit:

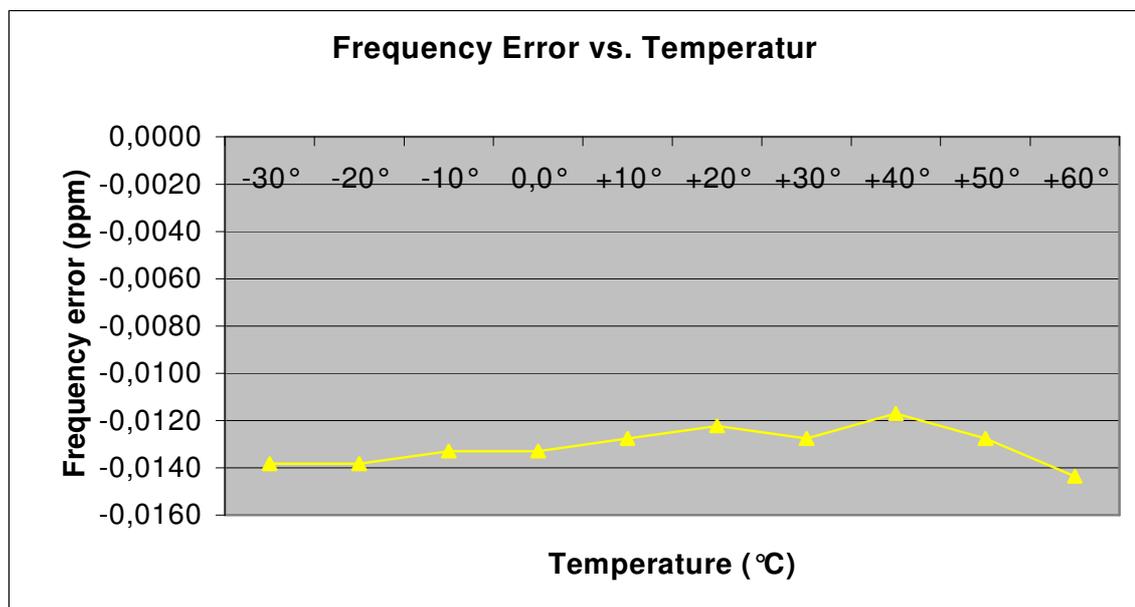

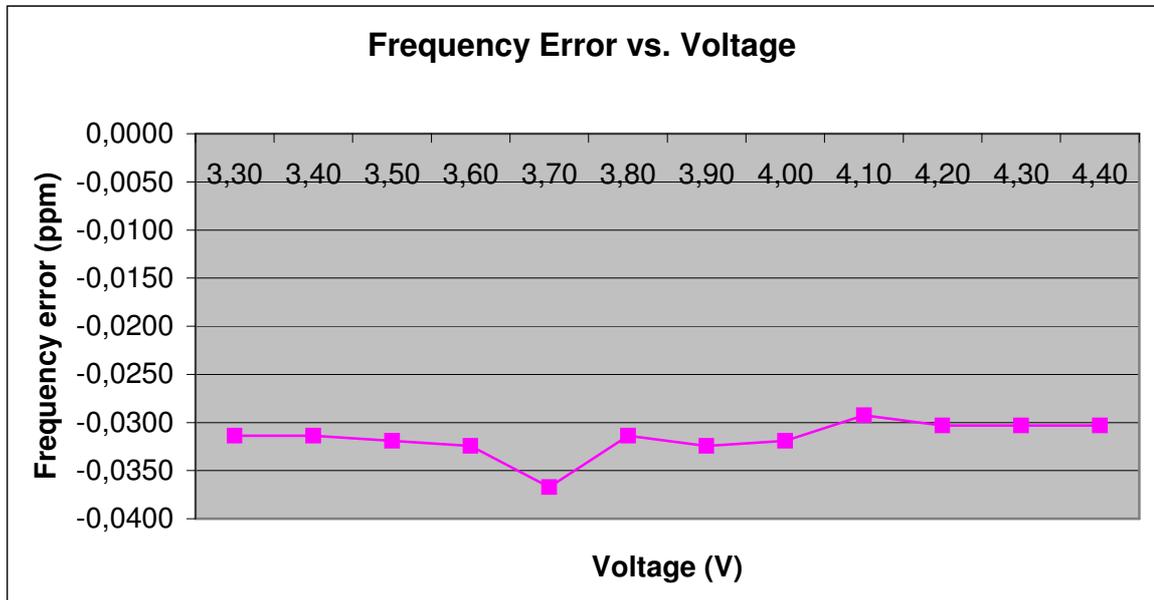

According to the JTC standard the frequency stability of the carrier shall be accurate to within 0.1 ppm of the received frequency from the base station. This accuracy is sufficient to meet Sec. 24.235, Frequency Stability. The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block..

Test Results: AFC FREQ ERROR vs. VOLTAGE

5.1.3 Radiated Emissions

Reference

| | |
|------|-------------------------------|
| FCC: | CFR Part 24.238, 2.1053 |
| IC: | RSS 133, Issue 4, Section 4.4 |

Measurement Procedure:

The following steps outline the procedure used to measure the radiated emissions from the mobile station. The site is constructed in accordance with ANSI C63.4:2003 requirements and is recognized by the FCC to be in compliance for a 3 and a 10 meter site. The spectrum was scanned from 30 MHz to the 10th harmonic of the highest frequency generated within the equipment, which is the transmitted carrier that can be as high as 1910 MHz. This was rounded up to 20 GHz. The resolution bandwidth is set as outlined in Part 24.238. The spectrum was scanned with the mobile station transmitting at carrier frequencies that pertain to low, mid and high channels of the USPCS band.

The final open field emission (here 10m semi-anechoic chamber listed by FCC) test procedure is as follows:

- a) The test item was placed on a 0.8 meter high non-conductive stand at a 3 meter test distance from the receive antenna.
- b) The antenna output was terminated in a 50 ohm load.
- c) A double ridged waveguide antenna was placed on an adjustable height antenna mast 3 meters from the test item for emission measurements.
- d) Detected emissions were maximized at each frequency by rotating the test item and adjusting the receive antenna height and polarization. The maximum meter reading was recorded. The radiated emission measurements of the harmonics of the transmit frequency through the 10th harmonic were measured with peak detector and 1 MHz bandwidth. If the harmonic could not be detected above the noise floor, the ambient level was recorded.
- e) Now each detected emissions were substituted by the Substitution method, in accordance with the TIA/EIA 603.

Measurement Limit:

Sec. 24.238 Emission Limits.

(a) On any frequency outside a licensee's frequency block (e.g. A, D, B, etc.) within the USPCS spectrum, the power of any emission shall be attenuated below the transmitter power (P, in Watts) by at least $43+10\log(P)$ dB. The specification that emissions shall be attenuated below the transmitter power (P) by at least $43 + 10 \log (P)$ dB, translates in the relevant power range (1 to 0.001 W) to -13 dBm. At 1 W the specified minimum attenuation becomes 43 dB and relative to a 30 dBm (1 W) carrier becomes a limit of -13 dBm. At 0.001 W (0 dBm) the minimum attenuation is 13 dB which again yields a limit of -13 dBm. In this way a translation of the specification from relative to absolute terms is carried out.

Measurement Results: Radiated Emissions

Radiated emissions measurements were made only at the upper, center, and lower carrier frequencies of the USPCS band (1850.2 MHz, 1880.0 MHz and 1909.8 MHz). It was decided that measurements at these three carrier frequencies would be sufficient to demonstrate compliance with emissions limits because it was seen that all the significant spurs occur well outside the band and no radiation was seen from a carrier in one block of the USPCS band into any of the other blocks. The equipment must still, however, meet emissions requirements with the carrier at all frequencies over which it is capable of operating and it is the manufacturer's responsibility to verify this.

The final open field radiated levels are presented on the next table.

All measurements were done in horizontal and vertical polarization; the plots show the worst case. As can be seen from this data, the emissions from the test item were within the specification limit.

| Harmonic | Tx ch.-512 Freq. (MHz) | Level (dBm) | Tx ch.-661 Freq. (MHz) | Level (dBm) | Tx ch.-810 Freq. (MHz) | Level (dBm) |
|----------|------------------------|-------------|------------------------|-------------|------------------------|-------------|
| 2 | 3700.4 | - | 3760 | - | 3819.6 | - |

5.1.5 Conducted Spurious Emissions

Reference

| | |
|------|-------------------------------|
| FCC: | CFR Part 24.238, 2.10.51 |
| IC: | RSS 133, Issue 4, Section 4.4 |

Measurement Procedure:

The following steps outline the procedure used to measure the conducted emissions from the mobile station.

1. Determine frequency range for measurements: From CFR 2.1057 the spectrum should be investigated from the lowest radio frequency generated in the equipment up to at least the 10th harmonic of the carrier frequency. For the mobile station equipment tested, this equates to a frequency range of 13 MHz to 19.1 GHz, data taken from 10 MHz to 20 GHz.
2. Determine mobile station transmit frequencies: below outlines the band edge frequencies pertinent to conducted emissions testing.

USPCS Transmitter Channel Frequency:

- 512 1850.2 MHz
- 661 1880.0 MHz
- 810 1909.8 MHz

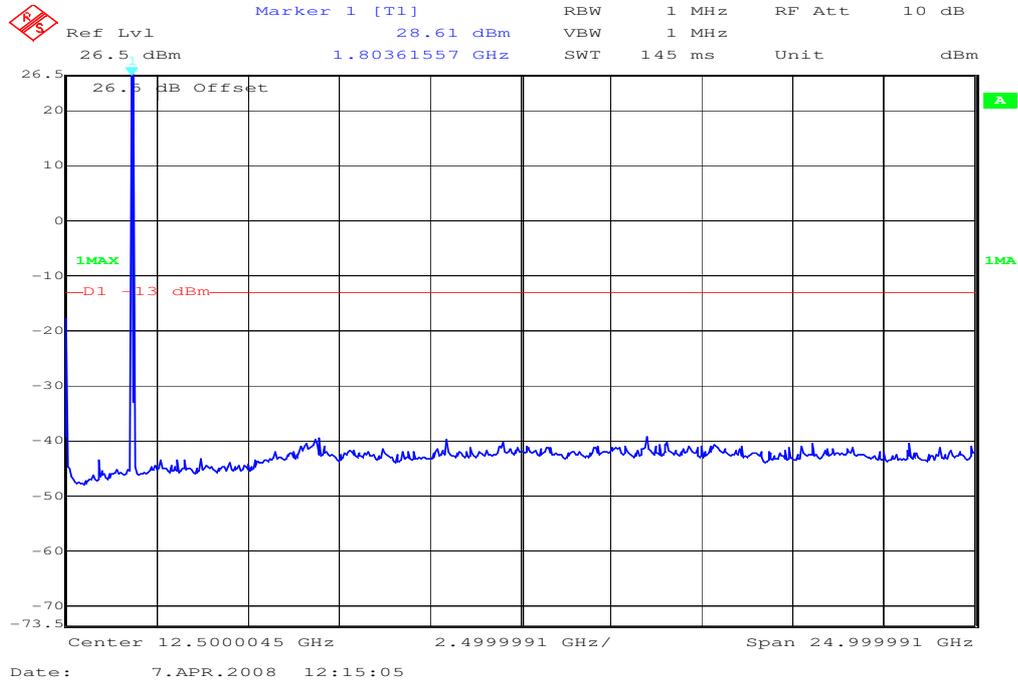

Measurement Limit:

(a) On any frequency outside frequency band of the USPCS spectrum, the power of any emission shall be attenuated below the transmitter power (P, in Watts) by at least $43+10\text{Log}(P)$ dB. For all power levels +30 dBm to 0 dBm, this becomes a constant specification limit of -13 dBm.

Measurement Results:

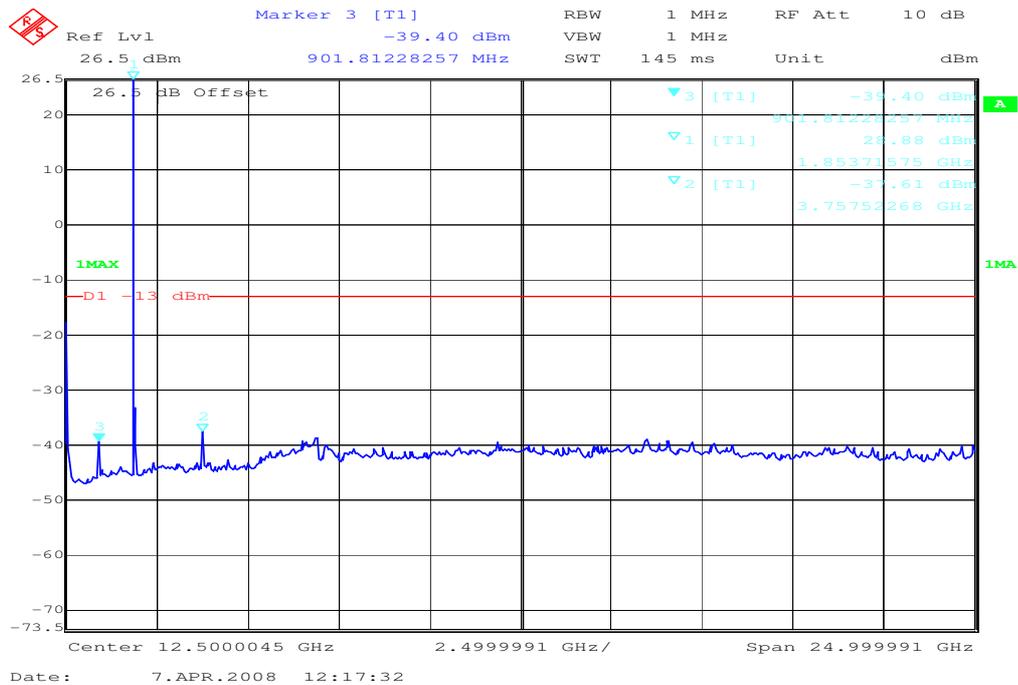

| Harmonic | Tx ch.-512 Freq. (MHz) | Level (dBm) | Tx ch.-661 Freq. (MHz) | Level (dBm) | Tx ch.-810 Freq. (MHz) | Level (dBm) |
|----------|------------------------|-------------|------------------------|-------------|------------------------|-------------|
| 2 | 3700.4 | - | 901.8 | - 39.40 | 3819.6 | - 38.71 |
| 3 | 5550.6 | - | 3760 | - 37.61 | 5729.4 | - |
| 4 | 7400.8 | - | 5640 | - | 7639.2 | - |
| 5 | 9251.0 | - | 7520 | - | 9549.0 | - |
| 6 | 11101.2 | - | 9400 | - | 11458.8 | - |
| 7 | 12951.4 | - | 11280 | - | 13368.6 | - |
| 8 | 14801.6 | - | 13160 | - | 15278.4 | - |
| 9 | 16651.8 | - | 15040 | - | 17188.2 | - |
| 10 | 18502.0 | - | 16920 | - | 19098.0 | - |

Channel: 512

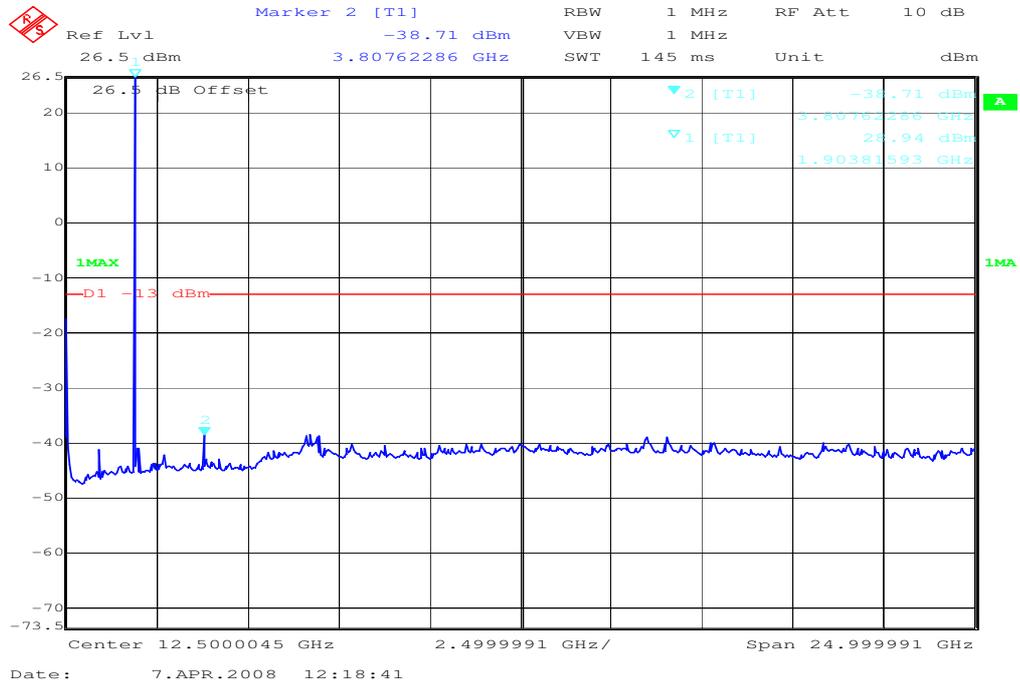

The Peak at the beginning of the Plot is the Local Oscillator. No spurious emissions were found.

Channel 661

The Peak at the beginning of the Plot is the Local Oscillator.

Channel 810

The Peak at the beginning of the Plot is the Local Oscillator.

5.1.6 Block Edge Compliance

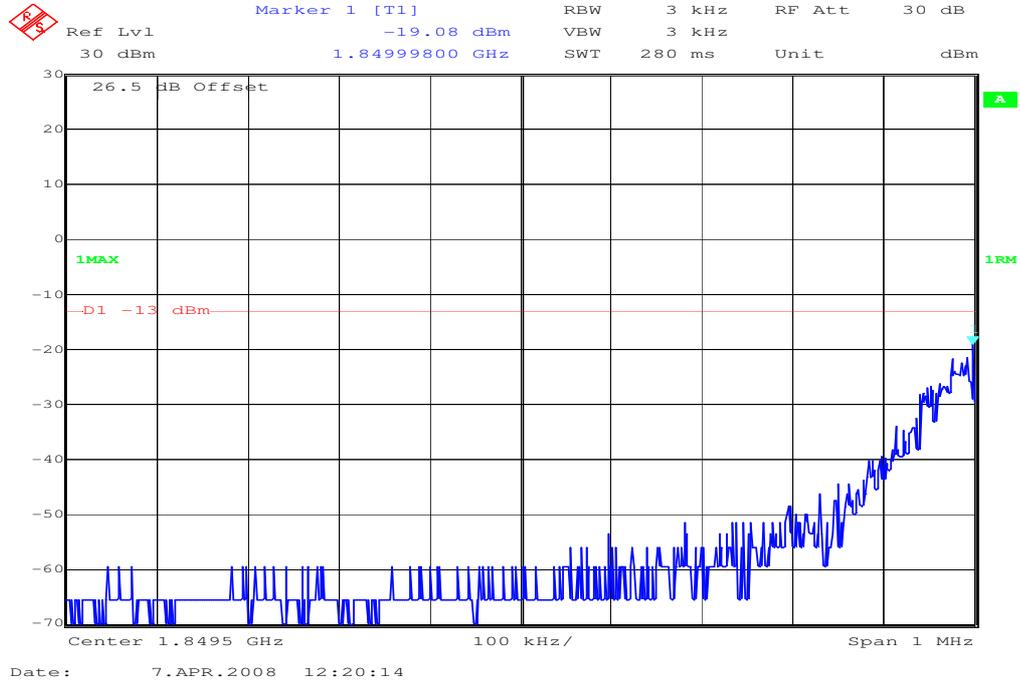

Reference

5.1.7 Occupied Bandwidth

Reference

| | |
|------|-------------------------------|
| FCC: | CFR Part 24.238, 2.1049 |
| IC: | RSS 133, Issue 4, Section 6.5 |

Occupied Bandwidth Results

Similar to conducted emissions, occupied bandwidth measurements are only provided for selected frequencies in order to reduce the amount of submitted data. Data were taken at the extreme and mid frequencies of the USPCS frequency band. Table 8.2 below lists the measured 99% power and -26dBC occupied bandwidths. Spectrum analyzer plots are included on the following pages.

Normal mode

| Frequency | 99% Occupied Bandwidth kHz | -26 dBc Bandwidth kHz |
|------------|-------------------------------|--------------------------|
| 1850.2 MHz | 260.080 | 318.056 |
| 1880.0 MHz | 292.024 | 316.052 |
| 1909.8 MHz | 276.032 | 320.040 |

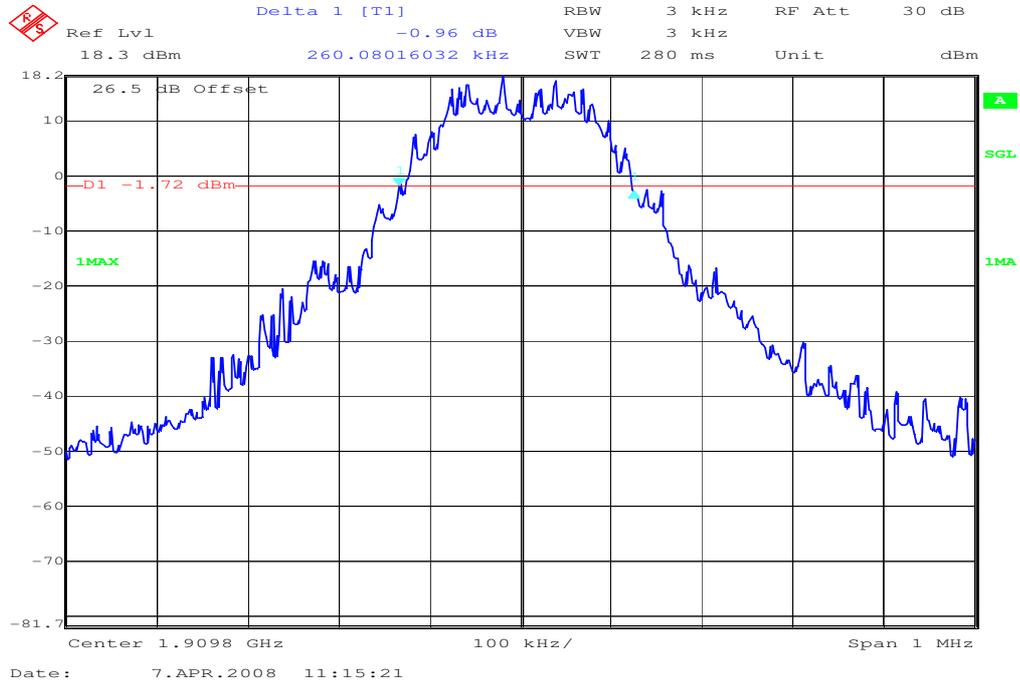

EDGE mode

| Frequency | 99% Occupied Bandwidth kHz | -26 dBc Bandwidth kHz |
|------------|-------------------------------|--------------------------|
| 1850.2 MHz | 258.036 | 320.000 |
| 1880.0 MHz | 300.100 | 334.008 |
| 1909.8 MHz | 260.080 | 320.020 |

Part 24.238 (a) requires a measurement bandwidth of at least 1% of the occupied bandwidth. For ca. 300.0 kHz, this equates to a resolution bandwidth of at least 3.0 kHz. For this testing, a resolution bandwidth 3.0 kHz was used.

5.2.1 RF Power Output

Reference

| | |
|------|---------------------------------------|
| FCC: | CFR Part 22.9.1.3, 2.1046 |
| IC: | RSS 132, Issue 2, Section 4.4 and 6.4 |

Summary:

This paragraph contains both average, peak output powers and EIRP measurements for the mobile station. In all cases, the peak output power is within the required mask (this mask is specified in the JTC standards, TIA PN3389 Vol. 1 Chap 7, and is no FCC requirement).

Method of Measurements:

The mobile was set up for the max. output power with pseudo random data modulation. The power was measured with R&S Signal Analyzer FSIQ 26 (peak and average) These measurements were done at 3 frequencies, 824.2 MHz, 836.4 MHz and 848.8 MHz (bottom, middle and top of operational frequency range).

Limits:

| |
|---------------------------------|
| Nominal Peak Output Power (dBm) |
| +38.45 |

Measurements Results Output Power (conducted)

| Frequency (MHz) | Peak Output Power (dBm) | Average Output Power (dBm) |
|-------------------------|-------------------------|----------------------------|
| 824.2 | 32.22 | 32.16 |
| 836.4 | 32.16 | 32.09 |
| 848.8 | 32.28 | 32.19 |
| Measurement uncertainty | ±0.5 dB | |

Measurements Results Output Power (conducted) 8-PSK Mode

|-------------------------|-------------------------|----------------------------|
| 824.2 | 30.82 | 27.66 |
| 836.4 | 31.08 | 27.67 |
| 848.8 | 30.77 | 27.54 |
| Measurement uncertainty | ±0.5 dB | |

ERP Measurements

Description: This is the test for the maximum radiated power from the phone.
 Rule Part 22.913 specifies that "Mobile/portable stations are limited to 7 watts ERP.

Measuring the EIRP of Spurious/Harmonic Emissions using Substitution Method

- (a) The measurements were performed with full rf output power and modulation.
- (b) Test was performed at listed 3m test site (listed with FCC, IC).
- (c) The transmitter under test was placed at the specified height on a non-conducting turntable (80 cm height)
- (d) The BICONILOG antenna (20 MHz to 1 GHz) or HORN antenna (1 GHz to 18 GHz) was used for measuring.
- (e) Load an appropriate correction factors file in EMI Receiver for correcting the field strength reading level
 Total Correction Factor recorded in the EMI Receiver = Cable Loss + Antenna Factor
 $E \text{ (dBuV/m)} = \text{Reading (dBuV)} + \text{Total Correction Factor (dB/m)}$
- (f) Set the EMI Receiver and #2 as follows:
 Center Frequency: test frequency
 Resolution BW: 100 kHz
 Video BW: same
 Detector Mode: positive
 Average: off
 Span: 3 x the signal bandwidth
- (g) The test antenna was lowered or raised from 1 to 4 meters until the maximum signal level was detected.
- (h) The transmitter was rotated through 360 o about a vertical axis until a higher maximum signal was received.
- (i) The test antenna was lowered or raised again from 1 to 4 meters until a maximum was obtained. This level was recorded.
- (j) The recorded reading was corrected to the true field strength level by adding the antenna factor, cable loss and subtracting the pre-amplifier gain.
- (k) The above steps were repeated with both transmitters' antenna and test receiving antenna placed in vertical and horizontal polarization. Both readings with the antennas placed in vertical and horizontal polarization shall be recorded.
- (l) Repeat for all different test signal frequencies

Measuring the ERP of Spurious/Harmonic Emissions using Substitution Method

- (a) Set the EMI Receiver (for measuring E-Field) and Receiver #2 (for measuring ERP) as follows:
 Center Frequency : equal to the signal source
 Resolution BW : 10 kHz
 Video BW : same
 Detector Mode : positive
 Average : off
 Span : 3 x the signal bandwidth
- (b) Load an appropriate correction factors file in EMI Receiver for correcting the field strength reading level
 Total Correction Factor recorded in the EMI Receiver = Cable Loss + Antenna Factor
 $E \text{ (dBuV/m)} = \text{Reading (dBuV)} + \text{Total Correction Factor (dB/m)}$
- (c) Select the frequency and E-field levels for ERP/EIRP measurements.
- (d) Substitute the EUT by a signal generator and one of the following transmitting antennas (substitution antenna):
 .DIPOLE antenna for frequency from 30-1000 MHz or .HORN antenna for frequency above 1 GHz }.
- (e) Mount the transmitting antenna at 1.5 meter high from the ground plane.
- (f) Use one of the following antenna as a receiving antenna: .DIPOLE antenna for frequency from 30-1000 MHz or .HORN antenna for frequency above 1 GHz }.
- (g) If the DIPOLE antenna is used, tune its elements to the frequency as specified in the calibration manual.
- (h) Adjust both transmitting and receiving antenna in a VERTICAL polarization.
- (i) Tune the EMI Receivers to the test frequency.
- (j) Lower or raise the test antenna from 1 to 4 meters until the maximum signal level was detected.
- (k) The transmitter was rotated through 360 o about a vertical axis until a higher maximum signal was received.
- (l) Lower or raise the test antenna from 1 to 4 meters until the maximum signal level was detected.
- (m) Adjust input signal to the substitution antenna until an equal or a known related level to that detected from the transmitter was obtained in the test receiver.
- (n) Record the power level read from the Average Power Meter and calculate the ERP/EIRP as follows:
 $P = P1 - L1 = (P2 + L2) - L1 = P3 + A + L2 - L1$
 $EIRP = P + G1 = P3 + L2 - L1 + A + G1$
 $ERP = EIRP - 2.15 \text{ dB}$

Total Correction factor in EMI Receiver # 2 = L2 – L1 + G1

Where: P: Actual RF Power fed into the substitution antenna port after corrected.

P1: Power output from the signal generator

P2: Power measured at attenuator A input

P3: Power reading on the Average Power Meter

EIRP: EIRP after correction

ERP: ERP after correction

(o) Adjust both transmitting and receiving antenna in a HORIZONTAL polarization, then repeat step (k) to (o)

(p) Repeat step (d) to (o) for different test frequency

(q) Repeat steps (c) to (j) with the substitution antenna oriented in horizontal polarization.

(r) Actual gain of the EUT’s antenna is the difference of the measured EIRP and measured RF power at the RF port.
Correct the antenna gain if necessary.

Limits:

| |
|---------------------------------|
| Nominal Peak Output Power (dBm) |
| +38.45 |

Measurement Results Output Power (Radiated) GMSK Mode

| Frequency (MHz) | Burst Peak (dBm) |
|-------------------------|------------------|
| 824.2 | 31.37 |
| 836.4 | 31.27 |
| 848.8 | 31.36 |
| Measurement uncertainty | ±0.5 dB |

Measurement Results Output Power (Radiated) 8-PSK Mode

| Frequency (MHz) | Burst Peak (dBm) |
|-------------------------|------------------|
| 824.2 | 31.63 |
| 836.4 | 31.83 |
| 848.8 | 31.61 |
| Measurement uncertainty | ±0.5 dB |

Sample calculation:

| Freg | SA Reading | SG Setting | Ant. gain | Dipol gain | Cable loss | ERP | Substitution Antenna |
|-------|------------|------------|-------------|-------------|------------|------|--------------------------|

| 848.8 | 137.8 | 26.6 | 8.4 | 0.0 | 3.3 | 31.7 | UHAP Schwarzbeck S/N 460 |

ERP = SG (dBm) - Cable Loss (dB) + Ant. gain (dB)

*ERP can be calculated from EIRP by subtracting the gain of the dipole, ERP = EIRP -2.1dB*i*

5.2.2 Frequency Stability

Reference

| | |
|------|---------------------------------------|
| FCC: | CFR Part 22.355, 2.1055 |
| IC: | RSS 132, Issue 2, Section 4.3 and 6.3 |

Method of Measurement:

In order to measure the carrier frequency under the condition of AFC lock, it is necessary to make measurements with the mobile station in a “call mode”. This is accomplished with the use of a R&S CMU 200 DIGITAL RADIOCOMMUNICATION TESTER..

1. Measure the carrier frequency at room temperature.
2. Subject the mobile station to overnight soak at -30 C.
3. With the mobile station, powered with 3.7 Volts, connected to the CMU 200 and in a simulated call on channel 661 (centre channel), measure the carrier frequency. These measurements should be made within 2 minutes of powering up the mobile station, to prevent significant self warming.
4. Repeat the above measurements at 10 C increments from -30 C to +60 C. Allow at least 1 1/2 hours at each temperature, un-powered, before making measurements.
5. Re-measure carrier frequency at room temperature with nominal 3.7 Volts. Vary supply voltage from minimum 3.3 Volts to maximum 4.4 Volts, in 13 steps re-measuring carrier frequency at each voltage. Pause at 3.7 V ac Volts for 1 1/2 hours un-powered, to allow any self heating to stabilize, before continuing.
6. Subject the mobile station to overnight soak at +60 C.
7. With the mobile station, powered with 3.7 Volts, connected to the CMU 200 and in a simulated call on channel 661(center channel), measure the carrier frequency. These measurements should be made within 2 minutes of powering up the mobile station, to prevent significant self warming.
8. Repeat the above measurements at 10 C increments from +60 C to -30 C. Allow at least 1 1/2 hours at each temperature, un-powered, before making measurements.
9. At all temperature levels hold the temperature to +/- 0.5 C during the measurement procedure.

Measurement Limit:

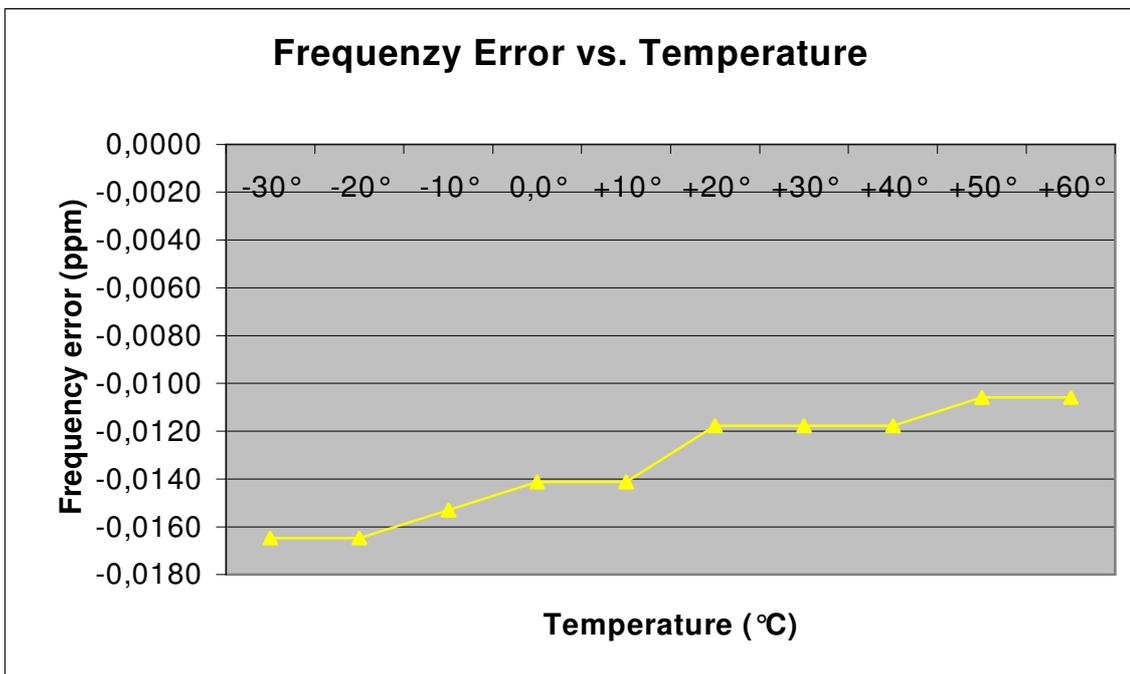

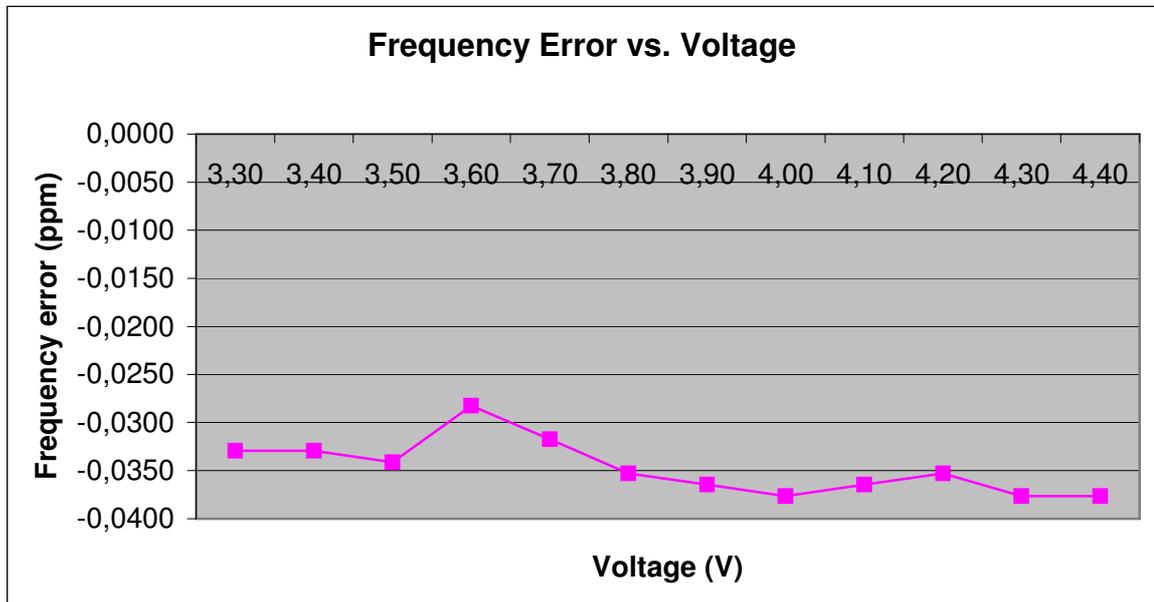

According to the JTC standard the frequency stability of the carrier shall be accurate to within 0.1 ppm of the received frequency from the base station. This accuracy is sufficient to meet Sec. 22.355, Frequency Stability. The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.. This transceiver is specified to operate with an input voltage of between 3.3 V dc and 4.4 V dc, with a nominal voltage of 3.7 V dc.

Measurement Results: AFC FREQ ERROR vs. VOLTAGE

5.2.3 Radiated Emissions

Reference

| | |
|------|---------------------------------------|
| FCC: | CFR Part 22.917, 2.1053 |
| IC: | RSS 132, Issue 2, Section 4.5 and 6.5 |

Measurement Procedure:

The following steps outline the procedure used to measure the radiated emissions from the mobile station. The site is constructed in accordance with ANSI C63.4:2003 requirements and is recognized by the FCC to be in compliance for a 3 and a 10 meter site. The spectrum was scanned from 30 MHz to the 10th harmonic of the highest frequency generated within the equipment, which is the transmitted carrier that can be as high as 848.8 MHz. This was rounded up to 12 GHz. The resolution bandwidth is set as outlined in Part 22.917. The spectrum was scanned with the mobile station transmitting at carrier frequencies that pertain to low, mid and high channels of the USPCS band.

The final open field emission (here 10m semi-anechoic chamber listed by FCC) test procedure is as follows:

- a) The test item was placed on a 0.8 meter high non-conductive stand at a 3 meter test distance from the receive antenna.
- b) The antenna output was terminated in a 50 ohm load.
- c) A double ridged wave guide antenna was placed on an adjustable height antenna mast 3 meters from the test item for emission measurements.
- d) Detected emissions were maximized at each frequency by rotating the test item and adjusting the receive antenna height and polarization. The maximum meter reading was recorded. The radiated emission measurements of the harmonics of the transmit frequency through the 10th harmonic were measured with peak detector and 1 MHz bandwidth. If the harmonic could not be detected above the noise floor, the ambient level was recorded. The equivalent power into a dipole antenna was calculated from the field intensity levels measured at 3 meters using the equation shown below:
- e) Now each detected emissions were substituted by the Substitution method, in accordance with the TIA/EIA 603 .

Measurement Limit:

Sec. 22.917 Emission Limits.

(a) On any frequency outside a licensee' s frequency block (e.g. A, D, B, etc.) within the USPCS spectrum, the power of any emission shall be attenuated below the transmitter power (P, in Watts) by at least $43+10\log(P)$ dB. The specification that emissions shall be attenuated below the transmitter power (P) by at least $43 + 10 \log (P)$ dB, translates in the relevant power range (1 to 0.001 W) to -13 dBm. At 1 W the specified minimum attenuation becomes 43 dB and relative to a 30 dBm (1 W) carrier becomes a limit of -13 dBm. At 0.001 W (0 dBm) the minimum attenuation is 13 dB which again yields a limit of -13 dBm. In this way a translation of the specification from relative to absolute terms is carried out.

Measurement Results:

Radiated emissions measurements were made only at the upper, center, and lower carrier frequencies of the USPCS band (824.2 MHz, 836.4 MHz and 848.8 MHz). It was decided that measurements at these three carrier frequencies would be sufficient to demonstrate compliance with emissions limits because it was seen that all the significant spurs occur well outside the band and no radiation was seen from a carrier in one block of the USPCS band into any of the other blocks. The equipment must still, however, meet emissions requirements with the carrier at all frequencies over which it is capable of operating and it is the manufacturer's responsibility to verify this.

The final open field radiated levels are presented on the next pages.

All measurements were done in horizontal and vertical polarization, the plots shows the worst case.

As can be seen from this data, the emissions from the test item were within the specification limit.

| Harmonic | Tx ch.-128 Freq. (MHz) | Level (dBm) | Tx ch.-189 Freq. (MHz) | Level (dBm) | Tx ch.-251 Freq. (MHz) | Level (dBm) |
|----------|---------------------------|----------------|---------------------------|----------------|---------------------------|----------------|
| 2 | 1648.4 | - 40.3 | 1672.8 | - 45.5 | 1697.6 | - |
| 3 | 2472.6 | - | 2509.2 | - | 2546.4 | - |
| 4 | 3296.8 | - | 3345.6 | - | 3395.2 | - |
| 5 | 4121.0 | - | 4182.0 | - | 4244.0 | - |
| 6 | 4945.2 | - | 5018.4 | - | 5092.8 | - |
| 7 | 5769.4 | - | 5854.8 | - | 5941.6 | - |
| 8 | 6593.6 | - | 6691.2 | - | 6790.4 | - |
| 9 | 7417.8 | - | 7527.6 | - | 7639.2 | - |
| 10 | 8242.0 | - | 8364.0 | - | 8488.0 | - |

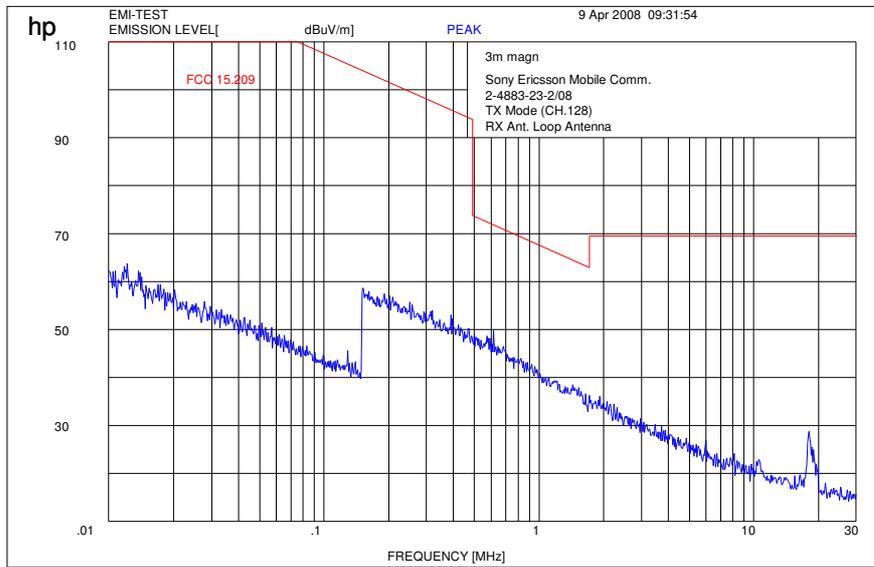

Sample calculation:

| Freq | SA Reading | SG Setting | Ant. gain | Dipol gain | Cable loss | ERP | Substitution Antenna |
|-------|---------------|---------------|--------------|---------------|---------------|------|--------------------------|
| MHz | dB μ V | dBm | dB <i>i</i> | dB <i>d</i> | dB | dBm | |
| 848.8 | 137.8 | 26.6 | 8.4 | 0.0 | 3.3 | 31.7 | UHAP Schwarzbeck S/N 460 |

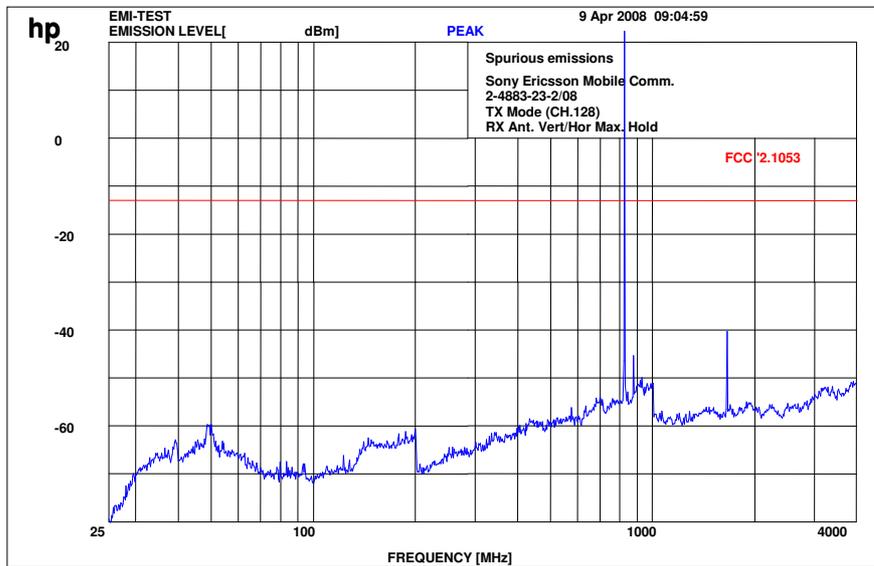

ERP = SG (dBm) - Cable Loss (dB) + Ant. gain (dB)

*ERP can be calculated from EIRP by subtracting the gain of the dipole, ERP = EIRP -2.1dB*i*

Traffic mode up to 30 MHz (Valid for all 3 channels)

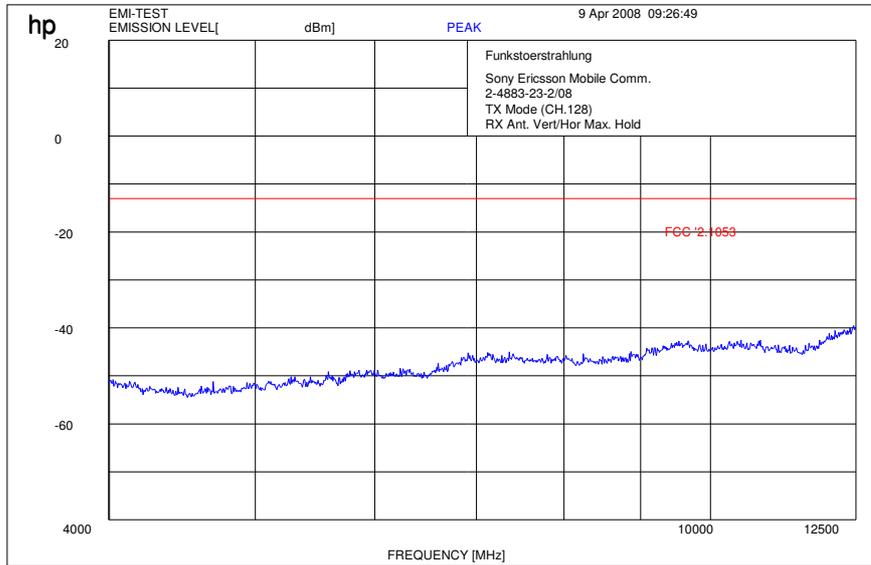

Channel 128 (30 MHz - 4 GHz)

5.2.5 Conducted Spurious Emissions

Reference

| | |
|------|---------------------------------------|
| FCC: | CFR Part 22.917, 1.1051 |
| IC: | RSS 132, Issue 2, Section 4.5 and 6.5 |

Measurement Procedure

The following steps outline the procedure used to measure the conducted emissions from the mobile station.

1. Determine frequency range for measurements: From CFR 2.1057 the spectrum should be investigated from the lowest radio frequency generated in the equipment up to at least the 10th harmonic of the carrier frequency. For the mobile station equipment tested, this equates to a frequency range of 13 MHz to 19.1 GHz, data taken from 10 MHz to 20 GHz.
2. Determine mobile station transmits frequencies: below outlines the band edge frequencies pertinent to conducted emissions testing.

USPCS Transmitter Channel Frequency

128 824.2 MHz

189 836.4 MHz

251 848.8 MHz

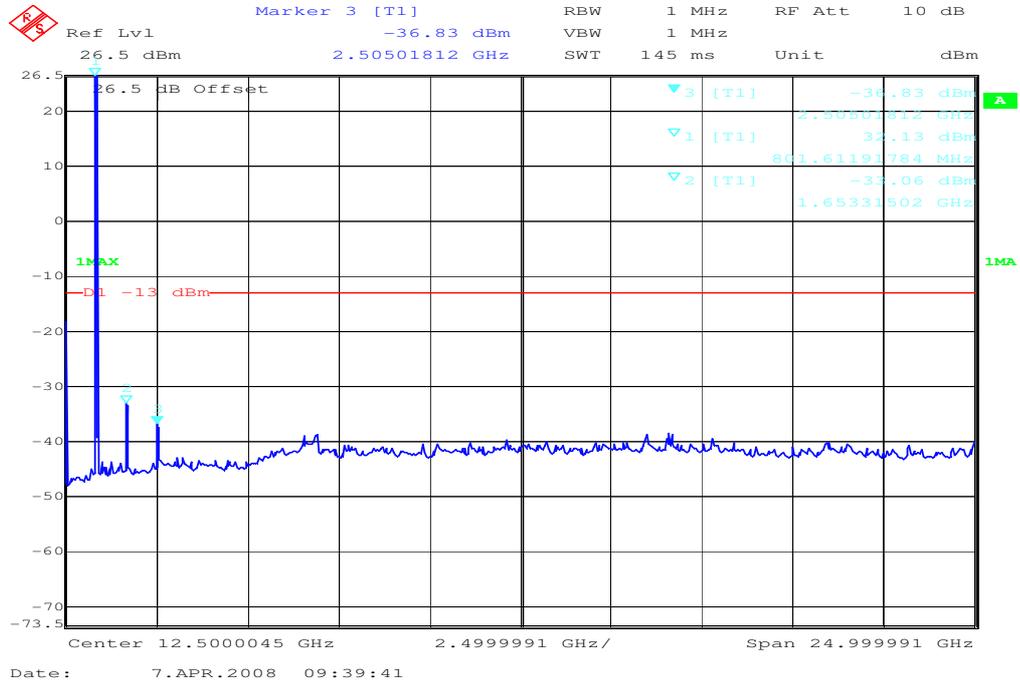

Measurement Limit

(a) On any frequency outside frequency band of the USPCS spectrum, the power of any emission shall be attenuated below the transmitter power (P, in Watts) by at least $43+10\log(P)$ dB. For all power levels +30 dBm to 0 dBm, this becomes a constant specification limit of -13 dBm.

Measurement Results

| Harmonic | Tx ch.-128 Freq. (MHz) | Level (dBm) | Tx ch.-189 Freq. (MHz) | Level (dBm) | Tx ch.-251 Freq. (MHz) | Level (dBm) |
|----------|---------------------------|----------------|---------------------------|----------------|---------------------------|----------------|
| 2 | 1648.4 | - 30.73 | 1672.8 | -32.79 | 1697.6 | - 33.06 |
| 3 | 2472.6 | - | 2509.2 | - 39.17 | 2546.4 | - 36.83 |
| 4 | 3296.8 | - | 3345.6 | - | 3395.2 | - |
| 5 | 4121.0 | - | 4182.0 | - | 4244.0 | - |

5.2.7 Occupied Bandwidth

Reference

| | |
|------|-------------------------------|
| FCC: | CFR Part 22.917, 2.1049 |
| IC: | RSS 132, Issue 2, Section 4.2 |

Occupied Bandwidth Results

Similar to conducted emissions, occupied bandwidth measurements are only provided for selected frequencies in order to reduce the amount of submitted data. Data were taken at the extreme and mid frequencies of the USPCS frequency band. Table below lists the measured 99% power and -26dBc occupied bandwidths. Spectrum analyzer plots are included on the following pages.

Normal mode

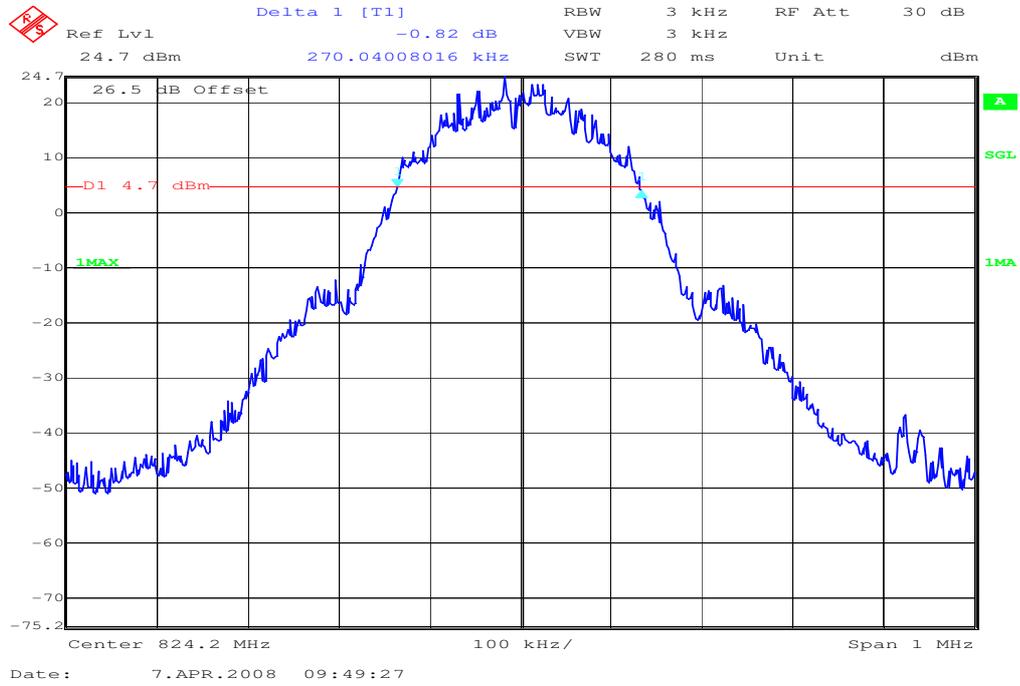

| Frequency | 99% Occupied Bandwidth (kHz) | -26 dBc Bandwidth (kHz) |
|-----------|------------------------------|-------------------------|
| 824.2 MHz | 270.040 | 310.020 |
| 836.4 MHz | 274.048 | 312.004 |
| 848.8 MHz | 276.032 | 316.032 |

EDGE mode

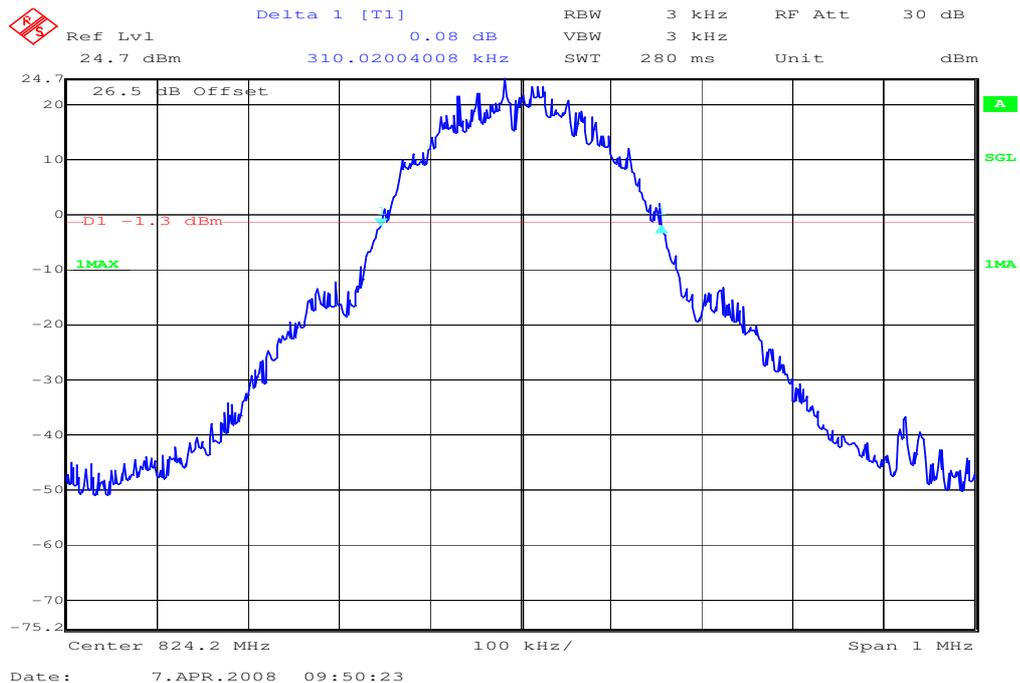

| Frequency | 99% Occupied Bandwidth (kHz) | -26 dBc Bandwidth (kHz) |
|-----------|------------------------------|-------------------------|
| 824.2 MHz | 268.036 | 334.028 |
| 836.4 MHz | 260.040 | 334.008 |
| 848.8 MHz | 260.080 | 320.020 |

Part 22 requires a measurement bandwidth of at least 1% of the occupied bandwidth. For ca. 300 kHz, this equates to a resolution bandwidth of at least 3 kHz. For this testing, a resolution bandwidth 3.0 kHz was used.
