Notes: -

4.1 EUT description

The EUT is a triple band (GSM 850/1800/1900 EGPRS) mobile phone.

The EUT was not modified during the tests.

5 EUT TEST SETUPS

For each test the EUT was exercised to find out the worst case of operation modes and device configuration.

6 APPLICABLE STANDARDS

The tests were performed in guidance of CFR 47 part 22, part 2, ANSI/TIA/EIA-603-A and RSS-132. Deviations, modifications or clarifications (if any) to above mentioned documents are written in each section under "Test method" for each test case.

Result	PASS		

9.1 Test setup

A set of LP/HP/BS filters was used to prevent overloading the spectrum analyzer. The BS simulator was used to set the TX channel and power level and modulate the TX signal with different bit patterns. The test was done using an automated test system, where the measurement devices were controlled by a computer.

9.2 Test method

- The emissions were searched and maximized by moving the turn table and measuring antenna and manipulating the EUT.
- All suspicious frequencies with emission levels were recorded.
- The EUT was replaced with a substituting antenna.
- For each frequency recorded, the substituting antenna was fed with the known power (from signal generator).

9.3 EUT operation mode

EUT operation mode	GSM, TX on, 1 time slot, PRBS 2E9-1 modulation data EGPRS, TX on, 1 time slot, PRBS 2E9-1 modulation data
EUT channel	190
EUT TX power level	Maximum

9.4 Limit

Frequency [MHz]	Level [dBm]
30 – 8500	-13

9.5 Results

The formula below was used to calculate the EIRP of the spurious emissions. If there were no emissions closer than 20dB below the limit line, then the emission levels were measured at the transmitter's harmonics.

$$\text{Correction Factor} = P_{\text{receiver}}[\text{dBm}] - P_{\text{SubstTX}}[\text{dBm}] - L_{\text{Cable}}[\text{dB}] + G_{\text{Antenna}}[\text{dBi}]$$

$$P_{\text{Emission}}[\text{dBm}] = P_{\text{Measured}}[\text{dBm}] - \text{Correction Factor}$$

where the variables are as follows:

P_{receiver} [dBm]	Measured emission level when substituting
Correction Factor	Calculated factor [dB]
$P_{\text{Subst_TX}}$ [dBm]	Signal generator power (from step d in 9.2) fed to the substituting antenna
L_{Cable} [dB]	Loss of the cable between antenna and signal generator (from step d in 9.2)
G_{Antenna} [dBd]	Gain of the substitutive antenna over dipole (dBi – 2.15dB)
P_{Emission} [dBm]	P_{Measured} [dBm] decreased with correction factor

10.4 Test method

- a) The climate chamber temperature was set to the minimum value and the temperature was allowed to stabilize.
- b) The EUT was placed in the chamber
- c) The EUT was set in idle mode for 45 minutes.
- d) The EUT was set to transmit.
- e) The transmit frequency error was measured immediately
- f) The steps c - e were repeated for each temperature
