

## **System summary**

Teliphone3100 is a VoIP (Voice over Internet Protocol) based telephone, which uses Internet circuitry (ADSL, cable, private line) in order to provide the user with the ability to place regular calls at low rates.

The Teliphone3100, which is manufactured under strict guidelines and thorough adherence to product quality can be used in the same manner that one utilizes a regular telephone and because it possesses a regular telephone (PSTN) backup (optional) function, upon connecting to the regular telephone extension, one can select to use the regular telephone function when placing calls. Because Teliphone3100 is produced according to Internet telephone standards, it is simple to connect to other equipment and VoIP internal and external webs can be constructed with ease. Also, for the user's convenience, a convenient menu is provided and regional support is offered through SNMP/Telnet.
