

Operating Description

The RMR-DLS350 radar detector is a dual conversion scanning super-heterodyne receiver with separate alarms for each of the radar bands, dim function, city/highway and mute select. It detects front and rear laser and radar. It contains VOICE alerts as well as selectable tones and a digital display of all functions.

The RMR-DLS350 has selectable VG-2, allowing the driver to select whether he wishes to scan for the presence of detector-detectors or not. The RMR-DLS350 is completely VG-2/VG-3 undetectable.

The RMR-DLS350 is built with high reliability surface mount construction and VCO technology for improved performance over a wide operating temperature. The RMR-DLS350 detects all radar and laser bands used by law enforcement:

10,475 – to – 10,575 MHz,
24,050 – to – 24,250 MHz,
and 33,400 – to – 36,000 MHz, as well as 904 nanometer infrared signals.

The RMR-DLS350 is compact, designed exclusively for automotive use and is powered by the 12-Volt electrical system in a car or truck.
