

## **Response to TCB Findings**

1. Please specify the material of the label that will be used on the module itself.  
**The label material is 3 mill mylar. Label document revised to include the material.**
2. Please identify the internal antenna on the PCB board. A picture pointing the antenna or a description of its location will be sufficient.  
**Attached is a picture with an arrow pointing to the permanently attached antenna.**
3. In the dwell time within 20s period plot on Pg 10 of the report, there seems to be many bursts that were not added to the dwell time. Please clarify how the dwell time was determined within 20s period.  
**The other bursts appearing in the same 0Hz bandwidth are broadband noise generated by nearby channels. The only emission to measure is the one at full amplitude.**
