Section 1. Summary Of Test Results

Manufacturer: RF SAW

Model No.: 501

Serial No.: 001

General: All measurements are traceable to national standards.

These tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with FCC Part 15.249. All tests were conducted using measurement procedure ANSI C63.4-2001. Radiated Emissions were made on an open area test site.

The antenna output connector is reverse gender SMA type. A variety of antennas are provided with the device depending on the installation environment. Compliance is not dependant on any particular antenna cable length. Antennas are provided with an adapter from a standard type connector to reverse gender SMA type. The adapter is permanently connected to the antenna with Loctite and heat shrink tubing. Thus a reverse gender SMA connection is permanently added to the antenna, making the connection on both the transmitter end and the antenna end non-standard type connections.

Description of Device Tested

The model 501 Reader is part of an RF ID system. The Reader transmits a swept signal across the 2.4 – 2.483 GHz band. Passive tags built on RF SAW (Surface Acoustic Wave) technology scatter the rf signal back in a pattern that is unique to the individual tag. The reader is thus able to identify the tag.

Section 3. Powerline Conducted Emissions

NAME OF TEST: Powerline Conducted Emissions	PARA. NO.: 15.207
TESTED BY: Brian Boyea	DATE: 8 Sept. 2004

Minimum Standard: Class B limits

Test Results: Complies. See attached graph(s).

Measurement Data: See attached graph(s).

Method of Measurement: (Procedure ANSI C63.4-1992)

Measurements were made using a spectrum analyzer with 10 kHz RBW, Peak Detector. Any emissions that are close to the limit are measured using a test receiver with 10 kHz bandwidth, CISPR Quasi-Peak Detector.

Section 4. Radiated Emissions

NAME OF TEST: Radiated Emissions	PARA. NO.: 15.249
TESTED BY: Tom Tidwell	DATE: 8 September, 2004

Minimum Standard: Para no. 15.249

The field strengths shall not exceed the following:

Fundamental (MHz)	Field Strength (mV/m)	Field Strength (dBµV)	Harmonic (mV/m)	Harmonic (dBµV)
902-928	50	94	0.5	54
2400-2483.5	50	94	0.5	54

Field strength limits are specified at a distance of 3 metres.

Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated limits of 15.209 whichever is the less attenuation.

...for frequencies above 1000 MHz, the above field strength limits are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation.

Test Results: Complies

Measurement Data: See attached table.

Maximizing Emission Levels: The field strength of emissions is maximized by adjusting the azimuth of the turntable and the height of the antenna mast. Each transmit antenna is mounted per the installation instructions.

The supply voltage to the EUT was varied from 85% - 115% (102 – 138 Vac) of the nominal supply voltage (120 Vac) with no effect noted on rf output level.

Low, Mid, and High Channel frequencies were measured. The worst-case results are reported.
