Class II permissive change on AIR 21 B4A B12P B5P 1700/2100 MHz radio equipment with FCC ID: TA8AKRC118048-1 and IC: 287AB- AS1180481 (5 appendices)

Test object

Product name: AIR 21 B4A B12P B5P
Product number: KRC 118 048/1, R2A

Summary

See appendix 1 for general information and appendix 5 for external photos.

Standard	Compliant	Appendix
FCC CFR 47 / IC RSS-139 Issue 2		
2.1046 / RSS-139 6.4 RF power output	Yes	2
2.1051 / RSS-139 6.5 Spurious emission at antenna terminals	Yes	3
2.1053 / RSS-139 6.5 Field strength of spurious radiation	Yes	4

Note: Above RSS-139 items are given as cross-reference only. Measurements were performed according to ANSI procedures referenced by FCC and covered by SP's accreditation.

Appendix 1

Description of the test object

Equipment:	Product name: AIR 21 B4A B12P B5P Product number: KRC 118 048/1, R2A FCC ID TA8AKRC118048-1 IC 287AB-AS1180481 IC MODEL NO: AS1180481
Tested configuration:	Multi RAT (MR) WCDMA + LTE
Frequency bands:	TX: 2110 – 2155 MHz RX: 1710 – 1755 MHz
Antenna ports:	2 TX/RX ports, (internally connected to integrated Cross-Polarized antenna elements).
RF configurations Multi RAT:	WCDMA + LTE, MIMO 2x2
Maximum nominal RF output power:	RF port A: 1-3 carriers WCDMA or 1-2 carriers LTE (total power 41.8 dBm, 15W) RF port B: 1-3 carriers WCDMA + 1-2 carriers LTE (total power 44.8 dBm, 30W)
Antenna type:	Cross- polarized antenna
Antenna gain:	18 dBi
WCDMA modulations:	QPSK, 16QAM and 64QAM
WCDMA channel bandwidths:	4.2 to 5 MHz (configurable in steps of 100/200 kHz)
WCDMA channel spacing:	4.4 to 5 MHz (configurable in steps of 100/200 kHz)
LTE Modulations:	QPSK, 16QAM and 64QAM
LTE Channel bandwidths:	1.4 MHz, 3 MHz, 5 MHz, 10 MHz and 15 MHz.
Nominal supply voltage:	-48VDC

Appendix 1

Operation mode during measurements

MR, WCDMA + LTE

WCDMA measurements were performed with the test object transmitting test models as defined in 3GPP TS 25.141. Test model 1 (TM1) represent QPSK modulation. Test model 5 (TM5) represent 16QAM modulation and Test model 6 (TM6) represent 64QAM modulation.

LTE measurements were performed with the test object transmitting test models as defined in 3GPP TS 36.141. Test model E-TM1.1 represent QPSK modulation, test model E-TM3.2 represent 16QAM modulation and test model E-TM3.1 represent 64QAM modulation.

The settings below were deemed representative for all traffic scenarios when settings with different modulations, channel bandwidths, number of carriers and RF configurations has been tested to find the worst case setting. All measurements were performed with the test object configured for maximum transmit power. The settings below were used for all measurements if not otherwise noted.

WCDMA MIMO mode

TM5:8 HS-PDSCH at 240ksps + 30 DPCH:s at 30 ksps (SF=128)

Channel bandwidth 5 MHz

LTE: E-TM1.1

Conducted measurements

The conducted measurements were performed on AIR 21 B4A B12P B8P with product number KRC 118 056/1 including the radio unit ARUS B4 1/KRC 118 046 which is identical for AIR 21 B4 B12P B5P and is representative for conducted TX performance measurements.

The test object was pole mounted and powered with -48 VDC by an external power supply, unless noted otherwise. All TX parameters were measured at port RF B with port RF A terminated into 50 ohm. Complete measurements were made on RF B with additional measurements on RF A.

Radiated measurements

The test object was pole mounted and powered with -48 VDC by an external power supply. Both RF ports were terminated into 50 ohm.

Purpose of test

The purpose of test is to justify a Class II Permissive Change of the test object with hardware update and to include the use of Multi RAT, by verifying compliance to the performance characteristics specified in applicable parts of FCC CFR 47, IC RSS-139 and IC RSS-Gen.

Uncertainties

Measurement and test instrument uncertainties are described in the quality assurance documentation "SP-QD 10885". The uncertainties are calculated with a coverage factor $k=2$ (95% level of confidence).

Compliance evaluation is based on a shared risk principle with respect to the measurement uncertainty.

Reservation

The test results in this report apply only to the particular test object as declared in the report.

Delivery of test object

The test object was delivered 2013-10-18.

Manufacturer's representative

Christer Gustavsson, Ericsson AB.

Test engineers

Andreas Johnson, Tomas Isbring, Tomas Lennhager, Kexin Chen, Jörgen Wassholm and Hyder Khalaf, SP.

Test participant

None.

¹⁾: Measured according to FCC KDB662911 D01 Multiple Transmitter Output v02r01. Method E), 2), c). “Measure and add $10 \log(N_{Ant})$ ”.

Limits

§27.50:

There is no maximum output power specified for base stations transmitting in the 2110-2155 MHz band. However, a licensee operating a base or fixed station in the 2110-2155 MHz band utilizing a power greater than 1640 watts EIRP and greater than 1640 watts/MHz EIRP must coordinate such operations in advance with the parties addressed in the rules.

In measuring transmissions in this band using an average power technique, the peak-to-average ratio (PAR) of the transmission may not exceed 13 dB.

RSS-139 6.4:

The average equivalent isotropically radiated power (e.i.r.p.) limits in SRSP-513 apply, resulting in a maximum EIRP of 1640 W/ MHz for the scope of this report. The peak-to-average ratio PAR of the power shall not exceed 13 dB.

Complies?	Yes
-----------	-----

Appendix 3

Conducted spurious emission measurements according to CFR 47 §27.53(h)/ IC RSS-139 6.5

Date	Temperature	Humidity
2013-11-12	21 °C ± 3 °C	35 % ± 5 %
2013-11-13	22 °C ± 3 °C	28 % ± 5 %

Test set-up and procedure

The measurements were made per definition in §27.53(h). The output was connected to a spectrum analyzer with a RBW setting of 1 MHz and RMS detector activated. The spectrum analyzer was connected to an external 10 MHz reference standard during the measurements.

Before comparing the results to the limit, 3 dB [10 log (2)] should be added according to method E), 3), (iii) “measure and add 10 log(N_{ANT})” of FCC KDB662911 D01 Multiple Transmitter Output v02r01.

Measurement equipment	SP number
R&S FSW 43	902 073

Testo 635, temperature and humidity meter	504 203

Measurement uncertainty: 3.7 dB

Results

Diagram	Tested configuration with symbolic name	Tested Port
1 a-e	B1.4	RF B
2 a-e	M1.4	RF B
3 a-e	M3	RF B
4 a-e	M5	RF B
5 a-e	M10	RF B
6 a-e	M15	RF B
7 a-e	T1.4	RF B

Appendix 3

Remark

The emission at 9 kHz on the plots was not generated by the test object. A complementary measurement with a smaller RBW showed that it was related to the LO feed-through.

The highest fundamental frequency is 2.155 GHz. The measurements were made up to 22 GHz (10x2.155 GHz = 21.55 GHz).

Limits

§27.53(h) and RSS-139 6.5

Outside a licensee's frequency band(s) of operation the power of any emission shall be attenuated below the transmitter power (P) by at least $43 + 10 \log (P)$ dB, resulting in a limit of -13 dBm per 1 MHz RBW.

Complies?	Yes

Field strength of spurious radiation measurements according to 47 CFR 27.53 (h) / IC RSS-139 6.5

Date	Temperature	Humidity
2013-11-03	23°C ± 3°C	42 % ± 5 %
2013-11-04	23°C ± 3°C	35 % ± 5 %

Test set-up and procedure

The test sites are listed at FCC, Columbia with registration number: 93866. The test site complies with RSS-Gen, Industry Canada file no. 3482A-1.

The measurements were performed with both horizontal and vertical polarization of the antenna. The antenna distance was 3 m in the frequency range 30 MHz – 18 GHz and 1m in the frequency range 18 - 22 GHz.

In the frequency range 30 MHz – 22 GHz the measurement was performed in power with a RBW of 1 MHz. A propagation loss in free space was calculated. The used formula was

$$\gamma = 20 \log \left(\frac{4\pi D}{\lambda} \right), \gamma \text{ is the propagation loss and } D \text{ is the antenna distance.}$$

The measurement procedure was as the following:

1. The pre-measurement was first performed with peak detector. The EUT was measured in eight directions and with the antenna at three heights, 1.0 m, 1.5 m and 2.0 m.
2. Spurious radiation on frequencies closer than 20 dB to the limit in the pre-measurement is scanned 0-360 degrees and the antenna is scanned 1- 4 m for maximum response. The emission is then measured with the RMS detector and the RMS value is reported. Frequencies closer than 10 dB to the limit when measured with the RMS detector were measured with the substitution method according to the standard.

Appendix 4

Representative test set-up during the spurious radiation measurements is shown in the picture below:
