2.1.4 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.1.5 Environmental Conditions

Ambient Temperature	20.2 - 22.5°C
Relative Humidity	51.8 – 62.5%

2.1.6 Test Method

The test was applied in accordance with the test method requirements of FCC Part 2 and KDB 971168 D01.

Using a power meter and attenuator(s), the output power of the EUT was measured at the antenna terminal. The path loss between the EUT and the power sensor was measured and recorded for the test band. The path loss was entered as an offset into the Power Meter and Spectrum Analyzer.

The EUT was configured to transmit on maximum power on the configurations defined in the tables below. Since the EUT transmits on eight antennas simultaneously in the same frequency range for MIMO devices, i.e., TX MIMO mode, using the Measure-and-Sum approach, the output power at all antennas were tested, and the total output power were then summed mathematically in linear power units according to FCC KDB 662911 D01.

A peak to average ratio measurement is performed at the conducted ports of the EUT for single carrier for Multiple RAT mode. The spectrum analyzers Complementary Cumulative Distribution Function (CCDF) was used and 0.1% probability value recorded.

The RMS Power and Peak to Average Ratio was measured and recorded with the results being compared with the limits.

This unit is tested without antenna. ERP/EIRP compliance is addressed at the time of licensing, as required by the responsible FCC. Licensees are required to take into account maximum allowed antenna gain used in combination with above power settings to prevent the radiated output power to exceed the limits.

The EUT was set to transmit at maximum power and testing was carried out on Bottom, Middle and Top Channels. Using the Occupied Bandwidth measurement function in the Spectrum Analyser, the Occupied Bandwidth is defined as the width of the signal between two points, one below the carrier centre frequency and one above the carrier centre frequency.

For FCC requirement, outside of which all emissions are attenuated by at least X dB below the transmitter power, where the value of X is typically specified as 26. The -26dBc Bandwidth was measured in accordance with FCC KDB 971168 D01 Clause 4.2.

The results are shown in the plots below.

2.3.6 Test Method

In accordance with FCC CFR 47 Part 27, Clause 27.53 (m) and Part 2, Clause 2.1051, any emissions outside of the block edges shall be attenuated by at least $43 + 10 \log (P)$. In the 1MHz bands immediately outside and adjacent to the frequency block, a resolution bandwidth of at least 1% of the emission bandwidth should be used.

For measurements of emissions $> 1\text{MHz}$ away from the band edges, an RBW of 1MHz or greater should be used. A resolution bandwidth of 100kHz was used between 1MHz to 6MHz from the band edge. to compensate for the reduced measurement bandwidth, the limit was adjusted with -13dB to -23dBm.

For $8 \times \text{MIMO}$ mode configurations, the limit was adjusted with a correction of -9dB $[10\text{Log}(8)]$ by using the Measure and Add $10\text{Log}(N)$ dB technique according to FCC KDB662911 D01 accounting for simultaneous transmission from antennas port RF 1 to RF 8.

For $4 \times \text{MIMO}$ mode configurations, the limit was adjusted with a correction of -6dB $[10\text{Log}(4)]$ by using the Measure and Add $10\text{Log}(N)$ dB technique according to FCC KDB662911 D01 accounting for simultaneous transmission from antennas port RF 1 to RF 4.

The path loss was measured and entered as a reference level offset. The EUT was set to transmit at its maximum rated output power in the configurations described in the tables below. Measurements were made at the Top and Bottom of the band.

The results are shown in the plots below.

2.4.5 Environmental Conditions

Ambient Temperature	21.5 - 22.0°C
Relative Humidity	30.0 - 34.2%

2.4.6 Test Method

The test was applied in accordance with test method requirements of ANSI/TIA-603-C-2004.

A preliminary profile of the Spurious Radiated Emissions was obtained by operating the EUT on a remotely controlled turntable within the chamber. Measurements of emissions from the EUT were obtained with the Measurement Antenna in both Horizontal and Vertical Polarisations.

Emissions identified within the range 30MHz – 27GHz were then formally measured using a Peak detector as the worst case.

In the frequency Range 30MHz – 27GHz, the measurement was performed with a resolution bandwidth of 1MHz.

The measurements were performed at a 3m distance unless otherwise stated.

The limits for Spurious Emissions have been calculated, as shown below using the following formula:

Field Strength of Carrier - $(43 + 10\log(P))$ dB

Where:

Field Strength is measured in dBμV/m

P is measured Transmitter Power in Watts

Determination of Spurious Emission Limit

As the EUT does not have an integral antenna, the field strength of the carrier has been calculated assuming that the power is to be fed to a half-wave tuned dipole as per 2.1053 (a).

$$E_{(v/m)} = (30 \times G_i \times P_o)^{0.5} / d$$

Where G_i is the antenna gain of an ideal half-wave dipole,
 P_o is the power out of the transceiver in W,
 d is the measurement distance in meter.

Therefore at 3m measurement distance the field strength using the lowest transceiver output power would be:

$$E_{(v/m)} = (30 \times 1.64 \times 4.79)^{0.5} / 3 = 5.12V/m = 134.18dB\mu V/m$$

As per 24.238(a) the spurious emission must be attenuated by $43 + 10\log(P_o)$ dB this gives:

$$43 + 10\log(4.79) = 49.80dB$$

Therefore the limit at 3m measurement distance is:

$$134.18 - 49.80 = 84.4 \text{ dB}\mu V/m$$

This limit has been used to determine Pass or Fail for the harmonics measured and detailed in the following results.

The results are shown in the plots below.

2.4.7 Test Results

Note: Only the worst case results plots have been included as all of the emissions are greater than 20dB below the limit. A set of plots have been included to show the measurement system noise floor.

2.5.6 Test Method

The test was applied in accordance with test method requirements of FCC Part 2 and KDB 971168 D01.

In accordance with FCC CFR 47 Part 2, Clause 2.1051, the spurious emissions from the antenna terminal were measured. In accordance with FCC CFR 47 Part 27, Clause 27.53 (m), any emissions outside of the block edges shall be attenuated by at least $43 + 10 \log (P)$.

The EUT was set to transmit at its maximum rated output power. The path loss between the Spectrum Analyser and the EUT was measured with the worst case level being entered as a Reference Level Offset. In accordance with 27.53 (m), the RBW was set to 1MHz and a Peak detector with the trace set to Max Hold was used. The frequency spectrum was then investigated between 9 kHz and 27GHz. Testing was carried out on the Bottom, Middle and Top channels.

For $8 \times$ MIMO mode configurations, the limit was adjusted with a correction of -9dB $[10\log(8)]$ by using the Measure and Add $10\log(N)$ dB technique according to FCC KDB662911 D01 accounting for simultaneous transmission from antennas port RF 1 to RF 8.

For $4 \times$ MIMO mode configurations, the limit was adjusted with a correction of -6dB $[10\log(4)]$ by using the Measure and Add $10\log(N)$ dB technique according to FCC KDB662911 D01 accounting for simultaneous transmission from antennas port RF 1 to RF 4.

The measurements were performed on the output connector RF 4. Limited complementary measurement were done at other output connectors to verify identical performance for all transmitter chains in MIMO mode.

The results are shown in the plots below.
