1.3 CONFIGURATION DESCRIPTION

The RRUS 32A B66A / KRC 161 601/1 supports single, dual, three and four carrier operation from either a single, dual or four port configuration. Pre-test results were used to establish the worst case configuration of the EUT in the above mentioned operating modes. The reported results represent testing in the worst case modes of operation. Testing was also carried out on all antenna ports to confirm that each output was electrically identical. Results of these tests are available on request.

The RRUS 32A B66A / KRC 161 601/1 supports WCDMA carriers in the 2110 to 2155 MHz frequency band and LTE carriers in the 2110 to 2180 MHz frequency band. Test Models as defined in 3GPP TS 25.141 and TS 36.141 were used to represent the required modulation for test.

TX test cases: Conducted Output Power, Spurious Emissions at Antenna Terminals (± 1 MHz) and Conducted Spurious Emissions measurements were performed on all RF Ports using a test limit accounting for MIMO operation with 4 ports. All RF ports were tested for RF Carrier Power and results recorded using the Measure and Sum approach to account for MIMO operation. The test limits shown are representative of the worst case. All testing was performed with the EUT transmitting at maximum RF output power unless otherwise stated.

The EUT was powered by a -48V DC Power supply.

1.5 PRODUCT INFORMATION

1.5.1 Technical Description

The RRUS 32A B66A (KRC 161 601/1) is a multi-standard radio forming part of Ericsson's RBS 6000 series Radio Base Station (RBS) equipment. The Antenna Radio Unit product provides radio access for mobile and fixed devices and is intended for the outdoor environment. Classed under ITE (Information Technology Equipment), the RRUS is designed to be co-located and directly mated with a compatible antenna, specified for path loss optimization. A fibre optic interface provides the ARUS RRUS / RBS control and digital communications between the Radio and RBS. The location of the RRUS with respect to the RBS is limited to a distance dictated by the limitations of the fibre link.

The RRUS 32A B66A supports four (4) Transmit / Receive ports operating in the LTE Band 66A at a Downlink (transmit) frequency from 2110 MHz to 2180 MHz and an Uplink (receive) frequency from 1710 MHz to 1780 MHz (WCDMA operation is restricted to Downlink (transmit) frequency from 2110 MHz to 2155 MHz and an Uplink (receive) frequency from 1710 MHz to 1755 MHz). The radio operates in FDD (Frequency Division Duplex) with a duplex spacing of 400 MHz and supports operation on multi Radio Access Transmission Standards (RATS) at transmit bandwidths up to 20 MHz.

The radio operates over 4 transmit ports in Single, Multi-Carrier, Mixed Mode, and MIMO transmission with a maximum rated RF output power of 30W per port over an operational temperature of -40° C to +55° C.

The RRUS is mounted directly behind a specified antenna along with a Fan Tray, which provides Forced Air Cooling for radio operation. The Fan Tray is powered and controlled from the RRUS via closed loop telemetry to maintain thermals through redundant variable speed fans to optimize air flow.

For directional optimization, the ARUS product has an active RET (Remote Electronic Tilt) function. Power for this option is provided via the RRUS RET interface (30V @ < 2A).

A full technical description can be found in the Manufacturer's documentation.

*- Reference Nemko Canada Inc. EMC Test Report: Reference Number 305067-1TRFWL-R1

1.7 TEST CONDITIONS

For all tests the EUT was set up in accordance with the relevant test standard and to represent typical operating conditions. Tests were applied with the EUT situated in a shielded enclosure, test laboratories or a chamber as appropriate.

The EUT was powered from a -48V DC supply.

1.8 DEVIATION FROM THE STANDARD

No deviations from the applicable test standards or test plan were made during testing.

1.9 MODIFICATION RECORD

No modifications were made to the EUT during testing.

1.10 ALTERNATIVE TEST SITE

Under our group UKAS Accreditation, TÜV SÜD Product Service conducted the following tests at Ericsson in Ottawa, Canada.

1.11 ADDITIONAL INFORMATION

Testing performed in the presence of Mr Denis Lalonde and Mr Mark McMullin.

Prior to commencement of the test, measurements were made in different carrier configurations to determine the worst case operating mode. The results reported indicate the identified worst case operating modes of the BTS. In addition, tests were performed on all ports to confirm that each radio was electrically identical.

FCC CFR 47 Part 27, Clause 27.50 (d)
Industry Canada RSS-139, Clause 6.5

2.1.2 Date of Test and Modification State

2.1.3 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.1.4 Environmental Conditions

Ambient Temperature	25.1 - 25.9°C
Relative Humidity	20.4 - 21.8%

2.1.5 Test Method

The EUT was connected to a Signal Analyser via attenuators and an RF switch. The path loss between the EUT and the Analyser was measured using a Network Analyser and entered as a Reference Level Offset.

The EUT was set to transmit at its maximum rated output power in the configurations described below.

Measurements were performed with the Analyser Band Power measurement function in accordance with FCC KDB 971168 D01 v02r02. The detector was set to RMS with a RBW of at least 1% of the theoretical signal bandwidth and a VBW of 3 times the RBW. The detection bandwidth was configured to be wider than the total bandwidth of the carrier or combinations of carriers, (multi-carrier). The sweep time was set to Auto and 200 averages were performed before the result was recorded.

Due to Average measurements being recorded, an additional Peak to Average measurement was made in all single carrier configurations. This was achieved using the CCDF function of the Analyser with the RBW being set to 80MHz (In this case 60MHz was the maximum total RF Bandwidth in single and multi-carrier mode).

In order to confirm the Average Equivalent Isotropically Radiated Power (EIRP) a Power Spectral Density (PSD) measurement was made in a 1MHz bandwidth.

Testing was performed on all ports.

An antenna gain of 18.1 dBi was applied to all results.

All measurements were summed in accordance with FCC KDB 662911 D01.

FCC CFR 47 Part 2, Clause 2.1049
FCC CFR 47 Part 27, Clause 27.53
Industry Canada RSS-GEN, Clause 6.6

2.2.2 Date of Test and Modification State

02 February 2016 - Modification State 0

2.2.3 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.2.4 Environmental Conditions

Ambient Temperature 25.4°C
Relative Humidity 20.4%

2.2.5 Test Method

The EUT was connected to a Signal Analyser via an attenuator and an RF switch. The path loss between the EUT and the Analyser was measured using a Network Analyser and entered as a Reference Level Offset.

The EUT was set to transmit at its maximum rated output power in the configurations described below.

The measurements were performed using the Analyser Occupied Bandwidth measurement mode function in accordance with FCC KDB 971168 D01 v02r02.

The Analyser RBW was configured to be at least 1% of the channel bandwidth of the carrier to be measured. A peak detector with the trace set to max hold was configured.

Testing was performed on all ports.
