Summary

Standard Listed part of		Compliant
FCC CFR 47 / IC RSS-132 ISSUE 3		
2.1046 / RSS-132 5.4	RF power output	Yes
2.1049 / RSS-Gen 4.6.1	Occupied bandwidth	Yes
2.1051 / RSS-132 5.5	Band edge	Yes
2.1051 / RSS-132 5.5	Spurious emission at antenna terminals	Yes
2.1053 / RSS-132 5.5	Field strength of spurious radiation	Yes
2.1055 / RSS-132 5.3	Frequency stability	Yes

Description of the test object

Equipment:	Radio equipment Radio 4478 B5 Product number KRC 161 689/1 and KRC 161 689/3 FCC ID: TA8AKRC161689 IC: 287AB-AS161689
HVIN:	AS161689
Hardware revision state:	R1A
Tested configuration:	Single RAT LTE
Frequency bands: 3GPP B5:	TX: 869 – 894 MHz RX: 824 – 849 MHz
IBW:	25 MHz 20 MHz for carrier BW $\leq$ 3 MHz
Output power:	Maximum output power / port: 40 W 20 W/ carrier for carrier BW $\leq$ 3 MHz
Antenna ports:	4 TX / 4 RX ports
Antenna:	No dedicated antenna, handled during licensing
RF configurations:	Single and multi-carrier, 1-6 carriers/ port TX Diversity, 2x2 MIMO, 4x4 MIMO, Contiguous Spectrum (CS), Carrier Aggregation (CA) intra-band and inter-band ¹ supported
Channel bandwidths:	1.4 MHz, 3 MHz, 5 MHz and 10 MHz
Modulations:	QPSK, 16QAM, 64QAM and 256QAM
RF power Tolerance:	+0.6/ -2.0 dB
CPRI Speed	Up to 10.1 Gbit/s

¹ Carrier Aggregation (CA) inter-band requires an additional unit operating on the other band.

The information above is supplied by the manufacturer.

Note: KRC 161 689/1 and KRC 161 689/3 are electrically identical according to the manufacturer. Only KRC 161 689/3 was tested.

Purpose of test

The purpose of the tests is to verify compliance to the performance characteristics specified in applicable items of FCC CFR 47.

Operation modes during measurements

LTE measurements were performed with the test object transmitting test models as defined in 3GPP TS 37.141. Test model E-TM1.1 was used to represent QPSK, test model E-TM3.2 to represent 16QAM, test model E-TM3.1 to represent 64QAM modulation and E-TM3.1A to represent 256QAM modulation.

All measurements were performed with the test object configured for maximum transmit power. The measured configurations covers worst case settings. The settings below were used for all measurements if not otherwise noted.

LTE MIMO mode
E-TM1.1
Channel bandwidth 5 MHz.

Conducted measurements

The test object was supplied with -48 VDC by an external power supply. Additional connections are documented in the set-up drawings for conducted measurements.

Radiated measurements

The test object was powered with -48 VDC by an external power supply. Additional connections are documented in the set-up drawings for radiated measurements.

Uncertainties

Measurement and test instrument uncertainties are described in the quality assurance documentation "SP-QD 10885". The uncertainties are calculated with a coverage factor $k=2$ (95% level of confidence).

Compliance evaluation is based on a shared risk principle with respect to the measurement uncertainty.

Reservation

The test results in this report apply only to the particular test object as declared in the report.

Delivery of test object

The test object was delivered: 2017-10-09.

Manufacturer's representative

Mikael Jansson, Ericsson AB.

Test engineers

Tomas Isbring for radiated tests, RISE

Tomas Lennhager and Andreas Johnson for conducted tests, RISE.

Test participant(-s)

None.

Test frequencies used for radiated and conducted measurements

EARFCN Downlink	Frequency [MHz]	Symbolic name	Comment
2407	869.7	B _{1.4}	TX bottom frequency in 1.4 MHz BW configuration
2415	870.5	B ₃	TX bottom frequency in 3 MHz BW configuration
2425	871.5	B ₅	TX bottom frequency in 5 MHz BW configuration
2450	874.0	B ₁₀	TX bottom frequency in 10 MHz BW configuration

Remark

This unit is tested without antenna. ERP/EIRP compliance is addressed at the time of licensing, as required by the responsible FCC/IC Bureau(s). Licensee's are required to take into account maximum allowed antenna gain used in combination with above power settings to prevent the radiated output power to exceed the limits.

Limits

- CFR47 § 22.913: The effective radiated power ERP shall not exceed 1000 W or 800 W/ MHz (PSD) per sector.
The PAR (0.1%) shall not exceed 13 dB.
- RSS-132 5.4: The average equivalent isotropically radiated power (e.i.r.p.) limits in SRSP-503 apply, resulting in a maximum EIRP of 1640 W.
The PAR (0.1%) shall not exceed 13 dB.

Complies?	Yes

Band edge measurements according to CFR 47 §2.1051 / IC RSS-132 5.5

Date	Temperature	Humidity
2017-10-25	24 °C ± 3 °C	29 % ± 5 %
2017-10-30	24 °C ± 3 °C	10 % ± 5 %

Test set-up and procedure

The measurements were made per definition in § 22.917. The test object was connected to a spectrum analyzer with the RMS detector activated. The spectrum analyzer was connected to an external 10 MHz reference standard during the measurements.

Before comparing the results to the limit, 6 dB [10 log (4)] to cover 4x4 MIMO, should be added according to method c “measure and add 10 log(N_{ANT})” of FCC KDB662911 D01 Multiple Transmitter Output.

Measurement equipment	RISE number
R&S FSW 43	902 073

Note: Measurements were mainly limited to port RF B due to the measurement result in single carrier mode that shows that the ports are electrical identical as declared by the client.

Remark

The emission at 9 kHz on the plots was not generated by the test object. A complementary measurement with a smaller RBW showed that it was related to the LO feed-through.

The highest fundamental frequency is 894 MHz. The measurements were made up to 9 GHz (10x894 MHz = 8.940 GHz).

Limits

CFR 47 § 22.917: Outside a licensee's frequency band(s) of operation the power of any emission shall be attenuated below the transmitter power (P) by at least $43 + 10 \log (P)$ dB, resulting in a limit of -13 dBm per 100 kHz RBW below 1 GHz and 1MHz RBW above 1 GHz.

IC RSS-132 5.5: Outside a licensee's frequency band(s) of operation the power of any emission shall be attenuated below the transmitter power (P) by at least $43 + 10 \log (P)$ dB per any 100 kHz RBW.

Diagram 17c:

Field strength of spurious radiation measurements according to 47 CFR 2.1053 / IC RSS-133 5.5

Date	Temperature	Humidity
2017-10-18	22 °C ± 3 °C	42 % ± 5 %

The test site conform to the site validation criterion specified in ANSI C63.4 2014. The test site complies with RSS-Gen, Industry Canada file no. 3482A-1.

The measurements were performed with both horizontal and vertical polarization of the antenna. The antenna distance and test object height in the different frequency ranges can be seen below.

The measurements were performed with both horizontal and vertical polarization of the antenna. The antenna distance was 3 m.

RF absorbers were covering a floor area in the frequency range 1 GHz – 9 GHz to comply with site validation requirements according to ANSI C63.4-2014.

The EUT was placed 0.8 m above reference ground plane in frequency range 30 MHz – 1 GHz and 1.5 m above reference ground plane in frequency range 1 GHz – 9 GHz.

The measurement was performed with a RBW of 1 MHz.

A propagation loss in free space was calculated. The used formula was

$$\gamma = 20 \log \left(\frac{4\pi D}{\lambda} \right), \gamma \text{ is the propagation loss and } D \text{ is the antenna distance.}$$

The measurement procedure was as the following:

1. A pre-measurement is performed with peak detector. For measurement < 1 GHz the test object was measured in eight directions with the antenna at three heights, 1.0 m, 1.5 m and 2.0 m. For measurements > 1 GHz the test object was measured in seventeen directions with the antenna height 1.0 m and 1.5 m.
2. Spurious radiation on frequencies closer than 20 dB to the limit in the pre-measurement is scanned 0-360 degrees and the antenna is scanned 1- 4 m for maximum response. The emission is then measured with the RMS detector and the RMS value is reported. Frequencies closer than 10 dB to the limit when measured with the RMS detector were measured with the substitution method according to ANSI 63.26.

The test set-up during the spurious radiation measurements is shown in the pictures below:

30-1000 MHz:

1-9 GHz:

Diagram 1a:

Note: The emission at 881.5 MHz is the carrier frequency and shall be ignored in the context.

Diagram 1b:

Frequency stability measurements according to CFR 47 §22.355 , 2.1055 / IC RSS 132 5.3

Date	Temperature (test equipment)	Humidity (test equipment)
2017-10-17	22 °C ± 3 °C	32 % ± 5 %
2017-10-18	22 °C ± 3 °C	39 % ± 5 %
2017-10-19	22 °C ± 3 °C	20 % ± 5 %
2017-10-26	22 °C ± 3 °C	28 % ± 5 %

Test set-up and procedure

The measurement was made per 3GPP TS 36.141. The output was connected to a spectrum analyser. The spectrum analyser was connected to an external 10 MHz reference standard during the measurements.

Measurement equipment	RISE number
Rohde & Schwarz signal analyzer FSQ 40	504 143
Rohde & Schwarz signal analyzer FSW 43	902 073
RF attenuator	900 691
Temperature Chamber	503 360
Testo 635, temperature and humidity meter	504 203
Multimeter Fluke 87	502 190

Results

Nominal transmitter frequency was 881.5 MHz (M) with a bandwidth of 5 MHz. Rated output power level at connector RF A (maximum): 46 dBm.

Test conditions		Frequency error (Hz)
Supply voltage DC (V)	Temp. (°C)	
40.8	+20	4
55.2	+20	3
48	+20	3
48	+30	4
48	+40	4
48	+50	5
48	+10	4
48	0	4
48	-10	4
48	-20	3
48	-30	4
Maximum freq. error (Hz)		5
Measurement uncertainty		$< \pm 1 \times 10^{-7}$

Remark

It was deemed sufficient to test one combination of TX frequency, channel bandwidth configuration and test model (modulation), as all combinations share a common internal reference to derive the TX frequency from.

Limits

Limit according to:

3GPP TS 36.141:

The frequency error shall be within $\pm 0.05 \text{ PPM} \pm 12 \text{ Hz}$ ($\pm 44.075 \text{ Hz}$).

§22.355

The frequency stability shall be within $\pm 1.5 \text{ ppm}$ ($\pm 1322.25 \text{ Hz}$).

RSS-132 5.3 Frequency:

The carrier frequency shall not depart from the reference frequency in excess of $\pm 1.5 \text{ ppm}$ ($\pm 1322.25 \text{ Hz}$) for base stations when tested to the temperature and supply voltage variations specified in RSS-Gen.

Complies?	Yes
