Summary

Standard Listed part of	Compliant
FCC CFR 47 part 22/ IC RSS-132, RSS-Gen	
2.1046/ 5.4 RF power output, conducted	Yes
2.1049/ 4.6.1 Occupied bandwidth	Yes
2.1051/ 5.5 Band edge	Yes
2.1051/ 5.5 Spurious emission at antenna terminals	Yes
2.1053/ 5.5 Field strength of spurious radiation	Yes
2.1055/ 5.3 Frequency stability	Yes

Description of the test object

Equipment:	Radio equipment Radio 4478 B5 Product number KRC 161 689/1 and KRC 161 689/3 FCC ID: TA8AKRC161689 IC: 287AB-AS161689
HVIN:	AS161689
FVIN:	CXP 901 3268/15, R68LT
Hardware revision state:	R2A
Tested configuration:	WCDMA single RAT
Frequency range:	TX: 869 – 894 MHz RX: 824 – 849 MHz
IBW:	25 MHz
Output power:	Max 40 W/ antenna port
Antenna ports:	4 TX/RX ports
Antenna:	No dedicated antenna, handled during licensing
RF configuration:	Single and multi-carrier, 1-5 carriers/ port 2x(2x2) MIMO, , Contiguous Spectrum (CS), Non-Contiguous Spectrum (NCS)
Modulations:	QPSK, 16QAM and 64QAM
Channel bandwidths:	3.8 to 5 MHz
RF power Tolerance:	+0.6/ -2.0 dB
CPRI Speed	Up to 10.1 Gbit/s
Nominal supply voltage:	-48VDC

The information above is supplied by the manufacturer.

Note: KRC 161 689/1 and KRC 161 689/3 are electrically identical according to the manufacturer. Only KRC 161 689/3 was tested.

Purpose of test

The purpose of this test is to justify a Permissive Change to include WCDMA

Operation modes during measurements

Measurements were performed with the test object transmitting the Test model 1 which are defined in 3GPP TS 25.141. Test model 1 (TM1) represent QPSK modulation. Test model 5 (TM5) includes the 16QAM modulation and Test model 6 (TM6) includes the 64QAM modulation.

All measurements were performed with the test object configured for maximum transmit power. The measured configurations covers worst case settings.

Conducted measurements

The test object was supplied with -48 VDC by an external power supply. Additional connections are documented in the set-up drawings for conducted measurements.

Radiated measurements

The test object was powered with -48 VDC by an external power supply. Additional connections are documented in the set-up drawings for radiated measurements.

Uncertainties

Measurement and test instrument uncertainties are described in the quality assurance documentation "SP-QD 10885". The uncertainties are calculated with a coverage factor $k=2$ (95% level of confidence).

Compliance evaluation is based on a shared risk principle with respect to the measurement uncertainty.

Reservation

The test results in this report apply only to the particular test object as declared in the report.

Delivery of test object

The test object was delivered: 2018-01-29.

Manufacturer's representative

Mikael Jansson, Ericsson AB.

Test engineers

Tomas Isbring for radiated tests, RISE.
Andreas Johnson for conducted tests, RISE.

Test participant(-s)

None.

Test frequencies used for radiated and conducted measurements

UARFCN Downlink B5	Frequency [MHz]	Symbolic name	Comment
4357	871.4	B	Single carrier TX bottom frequency
4408	881.6	M	Single carrier TX band mid frequency
4395 4420	879.0 884.0	M2	2-carriers TX band mid constellation
4357 4383 4408 4433 4458	871.4 876.6 881.6 886.6 891.6	M5	5-carriers TX band mid constellation
4458	891.6	T	Single carrier TX band top frequency
4433 4458	886.6 891.6	T2

Remark

ERP/EIRP compliance is addressed at the time of licensing, as required by the responsible FCC/IC Bureau(s). Licensee's are required to take into account maximum antenna gain used in combination with above power settings to prevent the radiated output power to exceed the limits.

Limits

CFR47 § 22.913: The effective radiated power ERP shall not exceed 1000 W or 800 W/ MHz (PSD) per sector.

The PAR (0.1%) shall not exceed 13 dB.

RSS-132 5.4: The average equivalent isotropically radiated power (e.i.r.p.) limits in SRSP-503 apply, resulting in a maximum EIRP of 1640 W.

The PAR (0.1%) shall not exceed 13 dB.

Complies?	Yes

Band edge measurements according to CFR 47 §2.1051 / IC RSS-132 5.5

Date	Temperature	Humidity
2018-02-02	21 °C ± 3 °C	10 % ± 5 %
2018-02-06		

Test set-up and procedure

The measurements were made per definition in CFR 47 §22.917. The test object was connected to a spectrum analyzer with the RMS detector activated. The spectrum analyzer was connected to an external 10 MHz reference standard during the measurements.

A RBW 1% of EBW was used up to 1 MHz away from the band edges. A smaller resolution bandwidth is permitted provided that the measured power is integrated over the full required measurement bandwidth. Where a smaller RBW was used the limit in the plot is adjusted by $10 \log (\text{RBW}_{\text{used}}/\text{RBW}_{\text{specified}})$ [dB] according to the following table:

Carrier BW:	RBW _{used}	RBW _{specified} (1% of EBW)	Limit correction	Adjusted limit
5 MHz	10 kHz	46.8 kHz	-6.7 dBm	-19.7 dBm

Before comparing the results to the limit, 6 dB [$10 \log (4)$] to cover 2x(2x2) MIMO, should be added according to method E)2)c) “Measure and add $10 \log (N_{\text{ANT}})$ ” of FCC KDB662911 D01 Multiple Transmitter Output.

Note: Measurements were mainly limited to port RF B due to the measurement result in single carrier mode that shows that the ports are electrical identical as declared by the client.

Remark

The emission at 9 kHz on the plots was not generated by the test object. A complementary measurement with a smaller RBW showed that it was related to the LO feed-through.

The highest fundamental frequency is 894 MHz. The measurements were made up to 9 GHz (10x894 MHz = 8940 MHz).

Limits

CFR 47 § 22.917: Outside a licensee's frequency band(s) of operation the power of any emission shall be attenuated below the transmitter power (P) by at least $43 + 10 \log (P)$ dB, resulting in a limit of -13 dBm per 100 kHz RBW below 1 GHz and 1MHz RBW above 1 GHz.

IC RSS-132 5.5: Outside a licensee's frequency band(s) of operation the power of any emission shall be attenuated below the transmitter power (P) by at least $43 + 10 \log (P)$ dB per any 100 kHz RBW.

2018-01-29	22 °C ± 3 °C	32 % ± 5 %
2018-01-30	22 °C ± 3 °C	30 % ± 5 %

The test site conform to the site validation criterion specified in ANSI C63.4 2014. The test site complies with RSS-Gen, Industry Canada file no. 3482A-1.

The measurements were performed with both horizontal and vertical polarization of the antenna. The antenna distance was 3 m in the frequency range 30 MHz – 9 GHz.

RF absorbers were covering a floor area in the frequency range 1 GHz – 9 GHz to comply with site validation requirements according to ANSI C63.4-2014.

The EUT was placed 0.8 m above reference ground plane in frequency range 30 MHz – 1 GHz and 1.5 m above reference ground plane in frequency range 1 GHz – 9 GHz.

The measurement was performed with a RBW of 1 MHz.

A propagation loss in free space was calculated. The used formula was

$$\gamma = 20 \log \left(\frac{4\pi D}{\lambda} \right), \gamma \text{ is the propagation loss and } D \text{ is the antenna distance.}$$

The measurement procedure was as the following:

1. A pre-measurement is performed with peak detector. For measurement < 1 GHz the test object was measured in eight directions with the antenna at three heights, 1.0 m, 1.5 m and 2.0 m. For measurements > 1 GHz the test object was measured in seventeen directions with the antenna height 1.0 m, 1.5 m and 2m.
2. Spurious radiation on frequencies closer than 20 dB to the limit in the pre-measurement is scanned 0-360 degrees and the antenna is scanned 1- 4 m for maximum response. The emission is then measured with the RMS detector and the RMS value is reported. Frequencies closer than 10 dB to the limit when measured with the RMS detector were measured with the substitution method according to ANSI 63.26.

The test set-up during the spurious radiation measurements is shown in the picture below:
30-1000 MHz

1-9 GHz

Measurement equipment

Measurement equipment	RISE number
Semi anechoic chamber Tesla	503 881
R&S ESU 40	901 385
EMC 32 ver. 10.20.01	BX62351
ETS Lindgren BiConiLog 3142E	BX61914
ETS Lindgren Horn Antenna 3115	502 175
µComp Nordic, Low Noise Amplifier	901 545
HP Filter 1-20 GHz	901 501
Temperature and humidity meter, Testo 625	504 188

Results

Tested configurations: B, M, T, M5, Bim and Tim
representing worst case: Symbolic name M, TM 1, Diagram 1 a-b

Frequency (MHz)	Spurious emission level (dBm)	
	Vertical	Horizontal
30-9000	All emission > 20 dB below limit	All emission > 20 dB below limit

Measurement uncertainty: 3.1 dB

Limits

CFR 47 § 22.917: Outside a licensee's frequency band(s) of operation the power of any emission shall be attenuated below the transmitter power (P) by at least $43 + 10 \log (P)$ dB, resulting in a limit of -13 dBm per 100 kHz RBW below 1 GHz and 1MHz RBW above 1 GHz.

IC RSS-132 5.5: Outside a licensee's frequency band(s) of operation the power of any emission shall be attenuated below the transmitter power (P) by at least $43 + 10 \log (P)$ dB per any 100 kHz RBW.

Complies?	Yes
-----------	-----

Diagram 1a:

Note: The emission at 881.6 MHz is the carrier frequency and shall be ignored in the context.

Diagram 1b:

Frequency stability measurements according to CFR 47 §22.35865, §2.1055 / IC RSS-132 5.3

Date	Temperature (test equipment)	Humidity (test equipment)
2018-02-09	21 °C ± 3 °C	12% ± 5 %
2018-02-13	21 °C ± 3 °C	16% ± 5 %
2018-02-14	21 °C ± 3 °C	15% ± 5 %

Test set-up and procedure

The measurement was made per 3GPP TS 25.141. The output was connected to a spectrum analyser.

Measurement equipment	RISE number
R&S FSQ 40	504 143
RF attenuator	900 691
Temperature Chamber	503 360
Testo 635, temperature and humidity meter	504 203
Multimeter Fluke 87	502 190

Results

Nominal transmitter frequency was 881.6 MHz (M) with a TM 1. Rated output power level at connector RF A (maximum): 46 dBm.

Test conditions		Frequency error (Hz)
Supply voltage DC (V)	Temp. (°C)	
40.8	+20	8
55.2	+20	6
48	+20	6
48	+30	15
48	+40	-10
48	+50	15
48	+10	-8
48	0	3
48	-10	8
48	-20	10
48	-30	35
Maximum freq. error (Hz)		35
Measurement uncertainty		$< \pm 1 \times 10^{-7}$

The frequency error results clearly shows that the frequency stability is good enough to ensure that the transmitted carrier stay within the operating band.

Remark

It was deemed sufficient to test one combination of TX frequency, channel bandwidth configuration and test model (modulation), as all combinations share a common internal reference to derive the TX frequency from.

Limits

3GPP TS 25.141:

The frequency error shall be within $\pm 0.05 \text{ PPM} \pm 12 \text{ Hz}$ ($\pm 44.08 \text{ Hz}$).

§22.355

The frequency stability shall be within $\pm 1.5 \text{ ppm}$ ($\pm 1322.4 \text{ Hz}$).

RSS-132 5.3 Frequency:

The carrier frequency shall not depart from the reference frequency in excess of $\pm 1.5 \text{ ppm}$ ($\pm 1322.4 \text{ Hz}$) for base stations when tested to the temperature and supply voltage variations specified in RSS-Gen.

Complies?	Yes
