Summary

Standard Listed part of	Compliant
FCC CFR 47 part 27	
2.1046 RF power output, conducted	Yes
2.1049 Occupied bandwidth	Yes
2.1051 Band edge	Yes
2.1051 Spurious emission at antenna terminals	Yes
2.1053 Field strength of spurious radiation	Yes
2.1055 Frequency stability	Yes

Description of the test object

Equipment:	Radio equipment Radio 4478 B71 Product number KRC 161 699/1 and KRC 161 699/3 FCC ID: TA8AKRC161699
Hardware revision state:	R1B
Tested configuration:	Single RAT LTE
Frequency bands: 3GPP B71:	TX: 617 – 652 MHz RX: 663 – 698 MHz
IBW:	35 MHz
Output power:	Max 40 W/ antenna port
Antenna ports:	4 TX / 4 RX ports
Antenna:	No dedicated antenna, handled during licensing
RF configurations:	Single and multi-carrier, 1-6 carriers/ port TX Diversity, 2x2 MIMO, 4x4 MIMO, Contiguous Spectrum (CS), intra band Carrier Aggregation (CA)
Channel bandwidths:	5 MHz, 10 MHz, 15 MHz and 20 MHz
Modulations:	QPSK, 16QAM, 64QAM and 256QAM
RF power Tolerance:	+0.6/ -2.0 dB
CPRI Speed	Up to 10.1 Gbit/s

The information above is supplied by the manufacturer.

Note: KRC 161 699/1 and KRC 161 699/3 are identical according to the manufacturer.

Purpose of test

The purpose of the tests is to verify compliance to the performance characteristics specified in applicable items of FCC CFR 47.

Operation modes during measurements

LTE measurements were performed with the test object transmitting test models as defined in 3GPP TS 37.141. Test model E-TM1.1 was used to represent QPSK, test model E-TM3.2 to represent 16QAM, test model E-TM3.1 to represent 64QAM modulation and E-TM3.1A to represent 256QAM modulation.

All measurements were performed with the test object configured for maximum transmit power. The measured configurations covers worst case settings. The settings below were used for all measurements if not otherwise noted.

LTE MIMO mode
E-TM1.1
Channel bandwidth 5 MHz.

Conducted measurements

The test object was supplied with -48 VDC by an external power supply. Additional connections are documented in the set-up drawings for conducted measurements.

Radiated measurements

The test object was powered with -48 VDC by an external power supply. Additional connections are documented in the set-up drawings for radiated measurements.

Uncertainties

Measurement and test instrument uncertainties are described in the quality assurance documentation "SP-QD 10885". The uncertainties are calculated with a coverage factor $k=2$ (95% level of confidence).

Compliance evaluation is based on a shared risk principle with respect to the measurement uncertainty.

Reservation

The test results in this report apply only to the particular test object as declared in the report.

Delivery of test object

The test object was delivered: 2017-09-07.

Manufacturer's representative

Mikael Jansson, Ericsson AB.

Test engineers

Tomas Isbring for radiated tests, RISE

Tomas Lennhager and Andreas Johnson for conducted tests, RISE.

Test participant(-s)

None.

Test frequencies used for radiated and conducted measurements

EARFCN Downlink	Frequency [MHz]	Symbolic name	Comment
68610	619.5	B ₅	TX bottom frequency in 5 MHz BW configuration
68635	622.0	B ₁₀	TX bottom frequency in 10 MHz BW configuration
68660	624.5	B ₁₅	TX bottom frequency in 15 MHz BW configuration
68685	627.0	B ₂₀	TX bottom frequency in 20 MHz BW configuration
68760	634.5	M ₅₋₂₀	TX mid frequency in 5-20 MHz BW configuration
68910	649.5	T ₅	TX top frequency in 5 MHz BW configuration
68885	647.0	T ₁₀	TX top frequency in 10 MHz BW configuration
68860	644.5	T ₁₅	TX top frequency in 15 MHz BW configuration
68835	642.0	T ₂₀	TX top frequency in 20 MHz BW configuration
68610 68660	619.5 624.5	B2	2 carriers TX 5 MHz configuration
68610 68660 68710 68760 68810 68860	619.5 624.5 629.5 634.5 639.5 644.5	B6	6 carriers TX 5 MHz configuration
68610 68660 68910	619.5 624.5 649.5	Bim	3 carriers TX 5 MHz configuration
68610 68860 68910	619.5 644.5 649.5	Tim	3 carriers TX 5 MHz configuration
68685 68860	627.0 644.5	CA ₂₀₋₁₅	Carrier Aggregation TX 20 MHz and 15 MHz configuration

All RX frequencies were configured 46 MHz above the corresponding TX frequency according the applicable duplex offset for the operating band.

Test setup: conducted measurements

Test object:

1.	Radio 4478 B71, KRC 161 699/1, rev. R1B, s/n: D16X059364 With Radio Software: CXP 901 7316/7, rev. R67HA. FCC ID: TA8AKRC161699

Remark

ERP/EIRP compliance is addressed at the time of licensing, as required by the responsible FCC/IC Bureau(s). Licensee's are required to take into account maximum antenna gain used in combination with above power settings to prevent the radiated output power to exceed the limits.

Limits

§27.50:

(c) (4) Fixed and base stations located in a county with population density of 100 or fewer persons per square mile, based upon the most recently available population statistics from the Bureau of the Census, and transmitting a signal with an emission bandwidth greater than 1 MHz must not exceed an ERP of 2000 watts/MHz and an antenna height of 305 m HAAT, except that antenna heights greater than 305 m HAAT are permitted if power levels are reduced below 2000 watts/MHz ERP in accordance with Table 4 of this section;

Limits

CFR 47 §27.53

(g) For operations in the 600 MHz band and the 698-746 MHz band, the power of any emission outside a licensee's frequency band(s) of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, by at least $43 + 10 \log (P)$ dB. Compliance with this provision is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kilohertz or greater. However, in the 100 kilohertz bands immediately outside and adjacent to a licensee's frequency block, a resolution bandwidth of at least 30 kHz may be employed.

Complies?	Yes

11 a-c	B6	RF C
12 a-c	Bim	RF C
13 a-c	Tim	RF C

Note: Measurements were mainly limited to port RF C due to the measurement result in single carrier mode that shows that the ports are electrical identical as declared by the client.

Remark

The emission at 9 kHz on the plots was not generated by the test object. A complementary measurement with a smaller RBW showed that it was related to the LO feed-through.

The highest fundamental frequency is 652 MHz. The measurements were made up to 7 GHz (10x652 MHz = 6520 GHz).

Limits

CFR 47 §27.53

(g) For operations in the 600 MHz band and the 698-746 MHz band, the power of any emission outside a licensee's frequency band(s) of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, by at least $43 + 10 \log (P)$ dB. Compliance with this provision is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kilohertz or greater. However, in the 100 kilohertz bands immediately outside and adjacent to a licensee's frequency block, a resolution bandwidth of at least 30 kHz may be employed.

The test sites are listed at FCC, Columbia with registration number: 93866. The test site complies with RSS-Gen, Industry Canada file no. 3482A-1.

The measurements were performed with both horizontal and vertical polarization of the antenna. The antenna distance was 3 m in the frequency range 30 MHz – 7 GHz.

The measurements in the frequency range 30 – 1000 MHz was performed with a RBW of 100 kHz and EUT at height of 80 cm. The measurements in the frequency range 1 – 7 GHz was performed with a RBW of 1 MHz and EUT at height of 150 cm and absorbers on the floor between EUT and the antenna.

A propagation loss in free space was calculated. The used formula was

$$\gamma = 20 \log \left(\frac{4\pi D}{\lambda} \right), \gamma \text{ is the propagation loss and } D \text{ is the antenna distance.}$$

The measurement procedure was as the following:

1. A pre-measurement is performed with peak detector. For measurement < 1 GHz the test object was measured in eight directions with the antenna at three heights, 1.0 m, 1.5 m and 2.0 m. For measurements > 1 GHz the test object was measured in seventeen directions with the antenna height 1.0 m and 1.5 m.
2. Spurious radiation on frequencies closer than 20 dB to the limit in the pre-measurement is scanned 0-360 degrees and the antenna is scanned 1- 4 m for maximum response. The emission is then measured with the RMS detector and the RMS value is reported. Frequencies closer than 10 dB to the limit when measured with the RMS detector were measured with the substitution method according to ANSI 63.26.

The test set-up during the spurious radiation measurements is shown in the pictures below:
30-1000MHz:

1-8GHz:

Diagram 1a:

Note: The emission at 634.5 MHz is the carrier frequency and shall be ignored in the context.

Diagram 1b:

Frequency stability measurements according to CFR 47 § 2.1055

Date	Temperature (test equipment)	Humidity (test equipment)
2017-09-26	22 °C ± 3 °C	46 % ± 5 %
2017-10-02	22 °C ± 3 °C	47 % ± 5 %
2017-10-03	22 °C ± 3 °C	48 % ± 5 %
2017-10-04	22 °C ± 3 °C	37 % ± 5 %

Test set-up and procedure

The measurement was made per 3GPP TS 36.141. The output was connected to a spectrum analyser. The spectrum analyser was connected to an external 10 MHz reference standard during the measurements.

The measurement was also made per IC RSS 199 Issue 3, 4.3. Using a resolution bandwidth of 1% of the emission bandwidth, a reference point at the unwanted emission level which complies with the attenuation of $43 + 10 \log_{10} p$ (watts) (i.e. -13 dBm) (for 4x 4MIMO -19 dBm) at the band edge of the lowest and highest channel was selected, and the frequency at these points was recorded as fL and fH respectively.

Measurement equipment	RISE number
Rohde & Schwarz signal analyzer FSQ 40	504 143
Rohde & Schwarz signal analyzer FSW 43	902 073
RF attenuator	900 691
Temperature Chamber	503 360
Testo 635, temperature and humidity meter	504 203
Multimeter Fluke 87	502 190

Results

Nominal transmitter frequency was 634.5 MHz (M) with a bandwidth of 5 MHz. Rated output power level at connector RF C (maximum): 46 dBm.

Test conditions		Frequency error (Hz)
Supply voltage DC (V)	Temp. (°C)	
40.8	+20	4
55.2	+20	3
48	+20	4
48	+30	4
48	+40	5
48	+50	5
48	+10	4
48	0	4
48	-10	4
48	-20	7
48	-30	5
Maximum freq. error (Hz)		7
Measurement uncertainty		$< \pm 1 \times 10^{-7}$

Rated output power level at connector RF C (maximum): 46 dBm

Test conditions			Frequency margin to band edge at -19dBm			
Supply voltage DC [V]	Temp [°C].	Carrier Bandwidth [MHz]	Test frequency Symbolic name Bottom		Test frequency Symbolic name Top	
			fL [MHz]	Offset to lower band edge (617 MHz) [kHz]	fH [MHz]	Offset to upper band edge (652 MHz) [kHz]
-48.0	+20	5	617.010	10	651.985	15
-48.0	+20	20	617.064	64	651.921	79

The frequency error results clearly shows that the frequency stability is good enough to ensure that the transmitted carrier stay within the operating band.

Remark

It was deemed sufficient to test one combination of TX frequency, channel bandwidth configuration and test model (modulation), as all combinations share a common internal reference to derive the TX frequency from.

Limits

§27.54

The frequency stability shall be sufficient to ensure that the fundamental emissions stay within the authorized bands of operation.

Complies?	Yes
