**ENGINEERING STATEMENT**

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported testing was carried out on a sample equipment to demonstrate compliance with FCC CFR 47: Part 24 and Industry Canada RSS-133. The sample tested was found to comply with the requirements defined in the applied rules.

### **REPORT SUMMARY**

FCC and Industry Canada Testing of the  
Ericsson AB  
RBS 6401 1.0 B2 LTE / KRD 901 040/6

## 1.1 INTRODUCTION

The information contained in this report is intended to show verification of the Ericsson AB RBS 6401 1.0 B2 LTE / KRD 901 040/6 to the requirements of FCC CFR 47 Part 24 and Industry Canada RSS-133.

Testing was carried out in support of an application for Grant of Equipment Authorisation in the name of RBS 6401 1.0 B2 LTE / KRD 901 040/6.

Objective	To perform FCC and Industry Canada Testing to determine the Equipment Under Test's (EUT's) compliance with the Test Specification, for the series of tests carried out.

## 1.4 PRODUCT INFORMATION

### 1.4.1 Technical Description

The Equipment Under Test (EUT) RBS 6401 1.0 B2 LTE / KRD 901 040/6 is an Ericsson AB Radio Equipment working in the public mobile service 1900MHz band which provides communication connections to LTE1900 network. The RBS 6401 1.0 B2 LTE / KRD 901 040/6 operates from a 120V AC, 60Hz supply.

The Equipment Under Test (EUT) is shown in the photograph below. A full technical description can be found in the Manufacturers documentation.

Equipment Under Test

#### 1.4.2 Test Configuration

##### Configuration 1: Base Station

The EUT was configured in accordance with FCC CFR 47 Part 24 and Industry Canada RSS-133.

The RBS 6401 1.0 B2 LTE / KRD 901 040/6 supports Test Models E-TM1.1, E-TM3.2 and E-TM3.1 at 1900MHz defined in 3GPP TS 36.141. Test Model E-TM1.1 was used to represent QPSK modulation only, Test Model E-TM3.2 was used to represent 16QAM modulation and Test Model E-TM3.1 was used to represent 64QAM modulation.

The settings below were found to be representative for all traffic scenarios when several settings with the different modulations and channel bandwidths were tested to find the worst case setting. These settings were used for all measurements if not otherwise noted:

Single carrier:

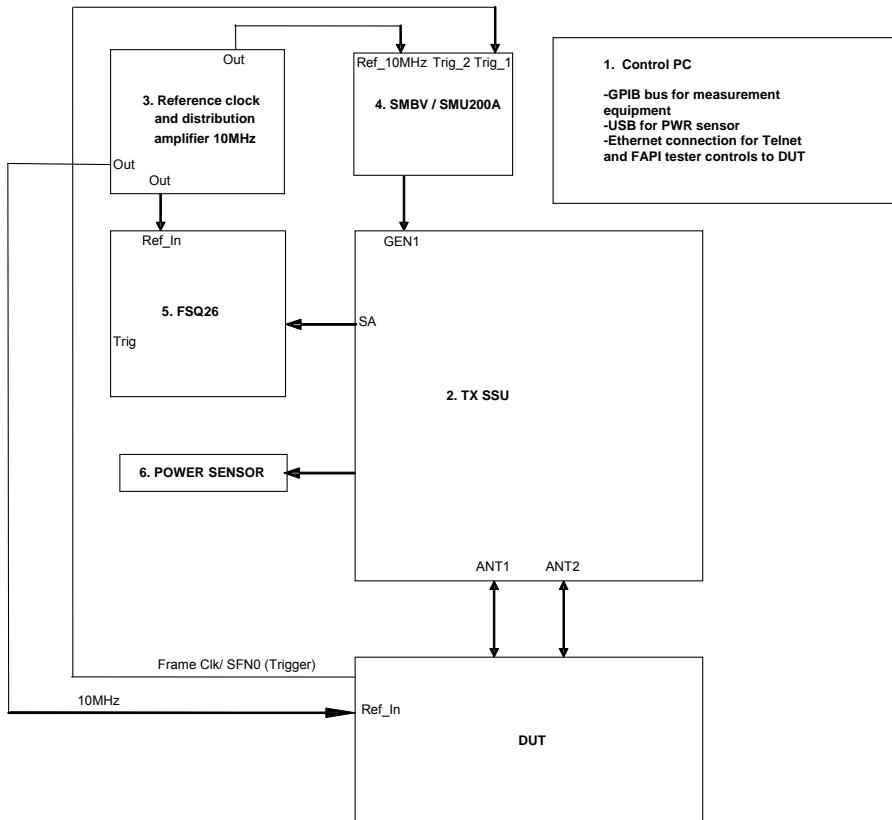

Test Model E-TM1.1 with channel bandwidths 5 MHz, 10 MHz and 20 MHz

The EUT can be configured to transmit with 1900MHz single carrier at the RF output connector. There are three options that can be fitted to an RBS 6401 base station, (i) a VDSL module (a Very-high-bit-rate Digital Subscriber Line, non-RF data transmission device), (ii) a WiFi module FCC ID: RAR 40025002 and IC ID: 4674A-40025002, and (iii) an External Antenna Kit. All Tx Testing was performed on the combined Tx / Rx output connector ANT A of the EUT. The complete testing was performed with the EUT transmitting at maximum RF power unless otherwise stated, VDSL enabled and WiFi enabled at 2.4GHz and 5 GHz. The EUT was powered by a 120V AC, 60Hz power supply unless otherwise stated.

#### 1.4.3 Modes of Operation

Modes of operation of each EUT during testing were as follows:

Bottom Channel :

Mode 1 - 5 : EARFCN 625: 1932.5MHz (5.0MHz Bandwidth)

Mode 1 - 10 : EARFCN 650: 1935.0MHz (10.0MHz Bandwidth)

Mode 1 - 20 : EARFCN 700: 1940.0MHz (20.0MHz Bandwidth)

Middle Channel :

Mode 2 : EARFCN 900: 1960.0MHz

Top Channel :

Mode 3 - 5 : EARFCN 1175: 1987.5MHz (5.0MHz Bandwidth)

Mode 3 - 10 : EARFCN 1150: 1985.0MHz (10.0MHz Bandwidth)

Mode 3 - 20 : EARFCN 1100: 1980.0MHz (20.0MHz Bandwidth)

Information on the specific test modes utilised are detailed in the test procedure for each individual test.

#### 1.5 TEST CONDITIONS

For all tests the EUT was set up in accordance with the relevant test standard and to represent typical operating conditions. Tests were applied with the EUT situated in a shielded enclosure, test laboratories or an open test area as appropriate.

The EUT was powered from a 120V AC, 60Hz supply.

#### 1.6 DEVIATIONS FROM THE STANDARD

No deviations from the applicable test standards or test plan were made during testing.

#### 1.7 MODIFICATION RECORD

No modifications were made to the EUT during testing.

### 2.1.4 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

### 2.1.5 Test Method and Operating Modes

The test was applied in accordance with the test method requirements of FCC CFR 47 Part 2 and Part 24 and Industry Canada RSS-133.

Using a thermal power sensor and attenuator(s), the output power of the EUT was measured at the antenna terminal. The carrier power was measured with E-TM1.1, E-TM3.2 and E-TM3.1 test models.

The path loss was measured and entered as a reference level offset.

The test was performed with the EUT in the following configurations and modes of operation:

Configuration 1 - Mode 1 – 5, Mode 1 – 10, Mode 1 – 20  
 - Mode 2 (5MHz, 10MHz, 20MHz)  
 - Mode 3 - 5, Mode 3 – 10, Mode 3 – 20

### 2.1.6 Environmental Conditions

30 August 2013

Ambient Temperature 25.9°C

Relative Humidity 33.4%

### 2.1.7 Test Results

For the period of test the EUT met the requirements of FCC CFR 47 Part 2 and Part 24 and Industry Canada RSS-133 for Maximum Peak Output Power.

The test results are shown below

## 2.2 PEAK – AVERAGE RATIO

### 2.2.1 Specification Reference

FCC CFR 47 Part 24, Clause 24.232 (d)

### 2.2.2 Equipment Under Test

RBS 6401 1.0 B2 LTE / KRD 901 040/6, S/N: C827268550

### 2.2.3 Date of Test and Modification State

02 September 2013 – Modification State 0

### 2.2.4 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

### 2.2.5 Test Method and Operating Modes

The test was applied in accordance with the test method requirements of FCC CFR 47 Part 24.

A peak to average ratio measurement is performed at the conducted port of the EUT. The spectrum analyser's Complementary Cumulative Distribution Function (CCDF) measurement profile is used to determine the largest deviation between the average and the peak power of the EUT in given bandwidth. The CCDF curve shows how much time the peak waveform spends at or above a given average power level. The percentage of time the signal spends at or above the level defines the probability for that particular power level.

The spectrum analyser measurement bandwidth was set to 5MHz when testing 5MHz OBW, 10MHz when testing 10MHz OBW and 12MHz when testing 20MHz OBW. The path loss was measured and entered as a reference level offset.

The test was performed with the EUT in the following configurations and modes of operation:

- Configuration 1
  - Mode 1 – 5, Mode 1 – 20
  - Mode 2 (5MHz, 10MHz, 20MHz OBW)
  - Mode 3 – 5, Mode 3 - 20

### 2.2.6 Environmental Conditions

02 September 2013

Ambient Temperature 26.2°C

Relative Humidity 36.5%

## 2.2.7 Test Results

For the period of test the EUT met the requirements of FCC CFR 47 Part 24 and Industry Canada RSS- 133 - Peak to Average Ratio.

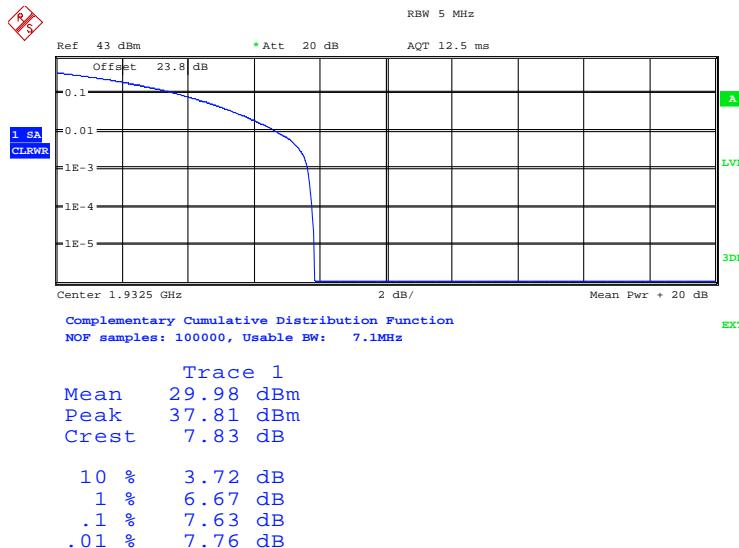

The test results are shown below

### 2.3.4 Test Method and Operating Modes

The test was applied in accordance with the test method requirements of FCC CFR 47 Part 2 and Industry Canada RSS-133.

The RF output port ANT A was connected to a spectrum analyser with an attenuator. All other ports were connected to match loads. The EUT was set to transmit at maximum power. The Code Domain Power and the constellation of the EUT was measured and recorded by the spectrum analyser.

The EUT supports QPSK, 16QAM and 64QAM modulations and was tested in 5.0MHz Bandwidth.

The test was performed with the EUT in the following configuration and mode of operation:

Configuration 1 - Mode 2 (5MHz OBW)

### 2.4.5 Test Method and Operating Modes

The test was applied in accordance with the test method requirements of FCC CFR 47 Part 2 and Part 24 and Industry Canada RSS-GEN.

The EUT was transmitting at maximum power, modulated using the test model described. The spectrum analyser measurement bandwidth was set to 50kHz when testing 5MHz OBW, 100kHz when testing 10MHz OBW and 200kHz when testing 20MHz OBW, the video bandwidth was set to 10 times the measurement bandwidth. The path loss was measured and entered as a reference level offset.

Measurement was made of the occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission. The -26dBc points were also established and the emission bandwidth determined.

The test was performed with the EUT in the following configurations and modes of operation:

Configuration 1

- Mode 1 – 5, Mode 1 – 20
- Mode 2 (5MHz, 10MHz, 20MHz OBW)
- Mode 3 – 5, Mode 3 – 20

### 2.5.3 Date of Test and Modification State

02 September 2013 – Modification State 0

### 2.5.4 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

### 2.5.5 Test Method and Operating Modes

The test was applied in accordance with the test method requirements of FCC CFR 47 Part 2 and Part 24 and Industry Canada RSS-133.

In accordance with 24.238(a), at least 1% of the 26dB bandwidth was used for the resolution and video bandwidths up to 1MHz away from the block edge. A resolution bandwidth of 50kHz was used up to 1MHz away from the band edges when measuring 5MHz Occupied Bandwidth, 100kHz when measuring 10MHz Occupied Bandwidth and 200kHz when measuring 20MHz Occupied Bandwidth. In all cases, the setting of the resolution bandwidth was >1% of the Emission Bandwidth (4.81MHz between the 26dB points for 5MHz nominal BW setting, 8.97MHz between the 26dB points for 10MHz nominal BW setting and 17.95MHz between the 26dB points for 20MHz nominal BW setting), therefore the limit was not required to be adjusted. A resolution bandwidth of 50kHz was used between 1MHz to 5MHz away from the band edge. As the FCC rules specify a RBW of 1MHz for measurements of emissions > 1MHz away from the band edges, the limit was adjusted by -13dB to -26dBm to compensate for the reduced measurement bandwidth. The Spectrum analyser detector was set to RMS.

The path loss was measured and entered as a reference level offset.

The EUT was tested at its maximum power level.

The test was performed with the EUT in the following configurations and modes of operation:

Configuration 1 - Mode 1 – 5, Mode 1 – 10, Mode 1 – 20  
 - Mode 3 – 5, Mode 3 – 10, Mode 3 – 20

## 2.5.6 Environmental Conditions

### 2.6.4 Test Equipment Used

### 2.6.5 Test Method and Operating Modes

The test was applied in accordance with the test method requirements of FCC CFR 47 Part 2 and Part 24 and Industry Canada RSS-133.

In accordance with Part 2.1051, the spurious emissions from the antenna terminal were measured. The transmitter output power was attenuated using an attenuator and the frequency spectrum investigated from 9kHz to 20GHz. The EUT was set to transmit on maximum power. The EUT was tested on Bottom, Middle and Top channels for E-TM1.1 test model in 5.0MHz and 20MHz bandwidth configurations as the representative modes. The resolution bandwidth was set to 1MHz for 9kHz to 20GHz thus meeting the requirements of Part 24.53(h). The spectrum analyser detector was set to peak and trace was kept on Max Hold.

The maximum path loss across each of the measurement bands was used as the reference level offset to ensure worst case.

In addition, measurements were made up to the 10<sup>th</sup> harmonic of the fundamental.

The test was performed with the EUT in the following configurations and modes of operation:

Configuration 1    - Mode 1 – 5, Mode 1 – 20  
                           - Mode 2 (5MHz, 20MHz OBW)  
                           - Mode 3 – 5, Mode 3 – 20

## 2.6.6 Environmental Conditions

03 September 2013

Ambient Temperature 23.8°C  
Relative Humidity 42.6%

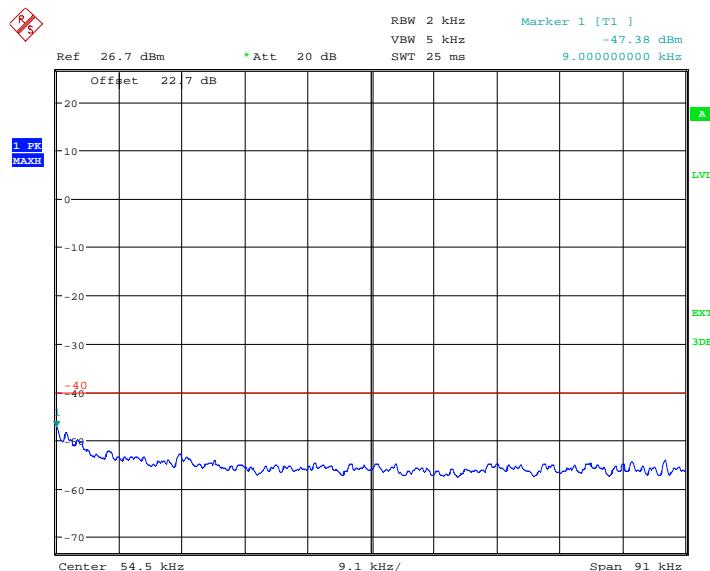

## 2.6.7 Test Results

For the period of test the EUT met the requirements of FCC CFR 47 Part 2 and Part 24 and Industry Canada RSS-133 for Conducted Spurious Emissions.

The test results are shown below

Remark:

The emissions at 9kHz on the plots were not generated by the test object. An additional measurement with a smaller span (reproduced in the plot below) showed that it was related to the LO feedthrough. The resolution bandwidth was set to 2kHz. As the FCC rules specify a RBW of 1MHz for measurements of emissions > 1MHz away from the band edges and to show a direct comparison with the 9kHz to 3GHz measurements, the limit was adjusted by -27dB to -40dBm to compensate for the reduced measurement bandwidth.
