1.2. Equipment (EUT)

Type of equipment	Quad band GSM/GPRS Tracker
Model Name	ST900 / ST910
FCC ID	WA2ST900
Tx frequency Band	824.2 ~ 848.8 MHz (GSM850) 1850.2 ~ 1909.8 MHz (GSM1900)
Rx frequency Band	869.2 ~ 893.8 MHz (GSM850) 1930.2 ~ 1989.8 MHz (GSM1900)
Max. Power Rating	21.45 dBm (GSM850) / 28.44 dBm (GSM1900)
Emission Designators	250K8GXW(GSM850) / 249K5GXW(GSM1900)
MODE	GSM / GPRS
Antenna Type	Intenna
Antenna Gain	-3 dBi (GSM850) / 1.5 dBi (GSM1900)
Power class	Class 4 for GSM850, Class 1 for GSM1900
Class of GPRS	10
Hardware Version	Ver0101
Software Version	Ver0202

1.4. Description of test mode

Band	Mode		Frequency (MHz)	Average Output Power (dBm)
GSM 850	GSM	Voice	824.2	31.42
			836.6	31.43
			848.8	31.45
	GPRS	1 Tx Slot	824.2	31.41
			836.6	31.42
			848.8	31.44
		2 Tx Slot	824.2	31.47
			836.6	31.47
			848.8	31.51

* We found out the test mode with the highest power level after we analyze all the data rates. So we chose GPRS 2 Tx Slot mode (worst case) as a representative of GSM 850 band.

Band	Mode		Frequency (MHz)	Average Output Power (dBm)

2. SUMMARY OF TEST RESULTS

Testing performed for : Suntech International Ltd.

Equipment Under Test : ST900

Receipt of Test Sample : 2010 .08. 07

Test Start Date : 2010. 08. 30

Test End Date : 2010. 09. 27

The following table represents the list of measurements required under the FCC CFR47 Part 22H and 24E.

FCC Rules	Test Requirements	Result
22.913(a), 24.232(c)	Conducted RF power output	Pass
22.913(a), 24.232(c)	ERP & EIRP	Pass
22.917, 24.238	Radiated Spurious Emission	Pass
2.1049	Occupied bandwidth	Pass
22.917, 24.238	Conducted Spurious Emission	Pass
22.355, 24.235	Frequency Stability	Pass

Note 1 : Test results reported in this document relate only to the items tested
Note 2 : The required tests demonstrated compliance as per client declaration of test configuration, monitoring methodology and associated pass/fail criteria
Note 3 : Test results apply only to the item(s) tested

*** Modifications required for compliance**
No modifications were implemented by KTL.
All results in this report pertain to the un-modified sample provided to KTL.

3. Measurement & Results

3.1. Conducted Output Power

3.1.1. Test Procedure

A base station simulator (CMU200) was used to establish communication with the EUT. The base station simulator parameters were set to produce the maximum power from the EUT. Conducted Output Powers of EUT are reported below.

3.1.2. Test Results

Mode		Frequency (MHz)	Average Output Power (dBm)
GSM 850	2 Tx Slot	824.2	31.47
		836.6	31.47
		848.8	31.51

Mode		Frequency (MHz)	Average Output Power (dBm)
GSM 1900	2 Tx Slot	1850.2	28.13
		1880.0	28.33
		1909.8	28.45

3.2. Effective Radiated Power

3.2.1. Test Procedure

The radiated and spurious measurements were made Fully-anechoic chamber at a 3-meter test range. The EUT was placed on the rotating device at 1.5m and at a distance of 3-meters from the receive antenna. The rotating device which can rotate horizontal axis was mounted on the turn unit to facilitate rotation around a vertical axis. The measurement was made for each horizontal/vertical position combination with receive antenna horizontally polarized. This measurement was repeated with receive antenna vertically polarized. The substitution antenna will replace the EUT antenna it the same position and in vertical polarization. The frequency of the signal generator shall be set to the frequencies that were measured on the EUT. The signal generator, output level, shall be adjusted until an equal or a known related level to what was measured from the EUT is obtained in the spectrum analyzer. This level was recorded. For readings above 1 GHz, the above procedure is repeated using horn antennas and the difference between the gain of the horn and an isotropic antenna are taken into consideration.

All modes of operation were investigated, and the worst-case results are reported.

3.2.2. Limit

FCC 22.913(b) : The Effective Radiated Power (ERP) of mobile transmitters must not exceed 7 Watts.
FCC 24.232(b) : The equivalent Isotropic Radiated Power (EIRP) must not exceed 2 Watts.

3.4. Occupied Bandwidth

3.4.1. Test Procedure

The EUT's output RF connector was connected with a short cable to spectrum analyzer. The EUT was setup to maximum output power. The EUT's occupied bandwidth is measured as the width of the signal between two points, one below the carrier center frequency and one above the carrier frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power. RBW was set to about 1% of emission BW, VBW is set to 3 times.

3.4.2. Limit

(a) On any frequency outside a licensee's frequency block, the power of any emission shall be attenuated below the transmitter power (P) by at least 43 + 10 log(P) dB
(b) Compliance with these provisions is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emission are attenuated at least 26 dB Below the transmitter power.
(c) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the license's frequency block edges, both upper and lower, as the design permits.
(d) The measurement of emission power can be expressed in peak or average values, provided they are expressed in the same parameters as the transmitter power.

Block 1 : 824 – 835 MHz (A* Low + A)

3.5. Conducted Spurious Emission

3.5.1. Test Procedure

The EUT's output RF connector was connected with a short cable to spectrum analyzer. The EUT was setup to maximum output power. The spectrum is scanned from the lowest frequency generated in the equipment up to a frequency including its 10th harmonic. Compliance with the out-of-band emissions requirement is based on test being performed with an analyzer resolution bandwidth of 1 MHz. However in the 1 MHz band immediately outside and adjacent to the frequency block a resolution bandwidth of at least 1% of the fundamental emissions bandwidth may be employed. A display line was placed at -13 dBm to show compliance.

3.5.2. Limit

On any frequency outside a licensee's frequency block, the power of any emission shall be attenuated below the transmitter power (P) by at least 43 + 10 log(P) dB. For all power levels +30 dBm to 0 dBm, this becomes a constant specification limit of -13 dBm.

3.6. Frequency Stability / Temperature Variation

3.6.1. Test Procedure

The equipment under test is placed in an environmental chamber. Frequency measurements are made at the extremes of the temperature range -30º C to +50º C and at intervals of 10º C with the primary supply voltage set to the nominal battery operating voltage. A period of time sufficient to stabilize all components of the equipment is allowed at each frequency measurement. The maximum variation of frequency is measured. The test was done at middle channel.

3.6.2. Limit

The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block. The frequency stability of the transmitter shall be maintained within ± 0.00025 (± 2.5ppm) of the center frequency.
