1.3 Statement of compliance

In the configuration tested, the EUT was found compliant.

Testing was performed against all relevant requirements of the test standard except as noted in section 1.5 below. Results obtained indicate that the product under test complies in full with the requirements tested. The test results relate only to the items tested.

See "Summary of test results" for full details.

Revision number	(BS) REV:09 H/W:A3; (CPE) REV:01 H/W:A7

3.3 Technical information

Frequency band	CBRS band: 3550–3700 MHz
Type of modulation	QPSK½ to 64QAM
Power requirements	48 V _{DC} via PoE powered from 120 V _{AC} / 60 Hz

3.4 Product description and theory of operation

The WiN51XX/WiN52XX ODU CPE is an IEEE 802.16-2005 compliant wireless device for deployment of point-to-multipoint (PMP) and point-to-point (PTP) network architectures.

The WiN51XX/WiN52XX ODU CPE is an outdoor device. The WiN51XX/WiN52XX ODU CPE is WiMAX Forum 802.16e Wave 2 (MIMO) Certified subscribers. Each subscriber registers and establishes a bi-directional data link with the base station sector controller.

The base station is connected to the head-end over IP Backhaul or via wireless channels. The outdoor CPEs are connected to the base station over wireless channels. The outdoor CPE is connected to the indoor residential gateway over Ethernet or coaxial networks.

The CPE consists of the following modules:

- * Base-Band board – including the WiMAX 16e MIMO Base-Band SoC (running the 16e MAC + PHY) plus the User Interface plus the analog front end that interface the RF module.
- * Power Supply board– DC/DC power supply. Converts the 48VDC to the various voltages that are feeding the Digital and the RF modules
- * RF board - Single transmit dual receive module that modulate the analog WiMAX signal input from the Base-Band modem to the high frequency RF output. The power amplifier has a step gain control, down to 20 dB of nominal gain.
- * Audio filter (WIN5137-DC Unit only)
- * Chassis

The WiN51XX/WiN52XX CPE uses time division duplexing (TDD) to transmit and receive on the same RF channel. This is a non-contention based method for providing an efficient and predictable two-way PTP or PMP cell deployment. All uplink and downlink transmission scheduling is managed by the base station.

The WiN51XX/WiN52XX CPE implements advanced automatic transmit power control, which allows the unit to operate with the minimum power necessary for successful communications. This control is based on information transmitted by the base-station and RSSI of the base-station.

The modulation technique specifies how the data is coded within the OFDMA carriers. The base station supports QPSK, 16 QAM, and 64 QAM modulations.

The WIN7237 Pico WiMAX BST is a single sector station used to enhance outdoor and indoor WiMAX coverage and capacity. The unit is easily installable, powered by PoE and supports remote management. WIN7237 provides the full base station functionality necessary for serving a single sector. It supports up to 512 subscriber units and its light weight and small footprint allow it to be easily mounted by one person on poles, street lamps or walls.

The WIN7237 is a member of the WIN-MAX E family, a line of mobile WiMAX broadband wireless access systems based on the 802.16e mobile WiMAX standard. WIN-MAX E systems are designed for robustness and simplicity, offering feature-rich services with low deployment and operation costs, for unmatched operator competitiveness and fast ROI.

WIN7237 provides all the functionality necessary to communicate with fixed and mobile subscriber units according to the service criteria and customer Service Level Agreements (SLA). The end-to-end Quality of Service (QoS) ensures the same high quality WiMAX experience is delivered to customers outside or inside his/her home or small office.

Frequency range: 3550–3700 MHz

Average output power: 27 dBm $\pm$ 1 dB max

The WIN7237 consists of the following modules:

- Base-Band board – including the WiMAX 16e MIMO Base-Band SoC (running the 16e MAC + PHY) plus the User Interface, GPS module for synchronization, DC/DC power supply and the analog front end that interface the RF module.
- RF board - Dual transmit & receive module that modulate the analog WiMAX signal input from the Base-Band modem to the high frequency RF output.
- Chassis

The WIN7237 uses time division duplexing (TDD) to transmit and receive on the same RF channel. This is a non-contention based method for providing an efficient and predictable two-way PTP or PMP cell deployment. The modulation technique specifies how the data is coded within the OFDMA carriers. The base station supports QPSK, 16 QAM, and 64 QAM modulations. The two transmitter chains are not correlated.

3.8 EUT security per CBRS requirements

Requirement	Compliance
What communication protocol is used between the SAS and the CBSD?	The SAS-CBSD protocol is based on the HTTPS (HTTP over TLS version 1.2). The HTTPS protocol provides transport level assurance that a message has been received by the intended recipient. Communication includes mutual authentication using pki certificates.
How are communications initiated?	Per standard specification, SAS server discovery: SAS server URL is provided to CBSD's. CBSD via domain proxy communicate to server per URL provided and TLS mutual authentication will be performed. The CBSD/Domain Proxy initiating the TLS connection shall authenticate the SAS, and the SAS shall authenticate the CBSD/Domain Proxy.
How does the CBSD validate messages from the SAS?	Each message session is encrypted and validated with TLSv1.2 and CA certificates verification. Messages also checked against protocol structure json.
How does the device handle failure to communicate or authenticate the SAS?	On communication failure/authentication, devices we re-try to communicate if fails, alarm will raise, and TX will stop.
How does the SAS validate messages from a CBSD?	Each message session is encrypted and validated with TLSv1.2 and CA certificates verification. Messages also checked against protocol structure json.
What encryption method is used?	TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
How does the SAS ensure secure registration of protected devices?	By using user name and ID, also CPI signature can be used.

Note: Protocols in accordance with: Document WINNF-TS-0016 Version V1.2.1 from January 3rd, 2018

Section 4. Engineering considerations

4.1 Modifications incorporated in the EUT

There were no modifications performed to the EUT during this assessment.

4.2 Technical judgment

None

4.3 Deviations from laboratory tests procedures

No deviations were made from laboratory procedures.

Section 5. Test conditions

5.1 Atmospheric conditions

Temperature	15–30 °C
Relative humidity	20–75 %
Air pressure	860–1060 mbar

When it is impracticable to carry out tests under these conditions, a note to this effect stating the ambient temperature and relative humidity during the tests shall be recorded and stated.

5.2 Power supply range

The normal test voltage for equipment to be connected to the mains shall be the nominal mains voltage. For the purpose of the present document, the nominal voltage shall be the declared voltage, or any of the declared voltages $\pm 5\%$, for which the equipment was designed.

Section 6. Measurement uncertainty

6.1 Uncertainty of measurement

UKAS Lab 34 and TIA-603-B have been used as guidance for measurement uncertainty reasonable estimations with regards to previous experience and validation of data. Nemko Canada, Inc. follows these test methods in order to satisfy ISO/IEC 17025 requirements for estimation of uncertainty of measurement for wireless products.

Measurement uncertainty budgets for the tests are detailed below. Measurement uncertainty calculations assume a coverage factor of $K = 2$ with 95% certainty.

Section 8. Testing data

8.1 6.1.4.1.2 [WINNF.FT.D.REG.2] Domain Proxy Multi-Step registration

8.1.1 Definitions and limits

6.1 CBSD Registration Process

This section provides test steps, conditions and procedures to test the conformance of the CBSD implementation for the CBSD Registration Procedure. A precondition is the CBSD has successfully discovered the SAS it wants to register with.

This test is mandatory for the Domain proxy that is controlling CBSDs which support multi-step registration. This test validates that each of the required parameters appear within the registration request message. This test case applies to Domain Proxy supervising two CBSDs.

8.1.2 Test date

Start date October 1, 2018

8.1.3 Observations, settings and special notes

None

8.1.4 Test data

Table 8.1-1: Test results

Step	Test Execution Steps	Pass	Fail
1	Ensure the following conditions are met for test entry: • UUT has successfully completed SAS Discovery and Authentication with SAS Test Harness • UUT is in the Unregistered state	–	–
2	DP with two CBSD sends correct Registration request information, as specified in [n.5], in the form of one 2-element Array or as individual messages to the SAS Test Harness: • The required userId, fcId and cbsdSerialNumber registration parameters shall be sent for each CBSD and conform to proper format and acceptable ranges. • Any REG-conditional or optional registration parameters that may be included in the message shall be verified that they conform to proper format and are within acceptable ranges.	☒	☐
3	• SAS Test Harness sends a CBSD Registration Response in the form of one 2-element Array or individual messages as follows: ○ cbsdId = Ci ○ measReportConfig shall not be included ○ responseCode = 0 for each CBSD	–	–
4	After completion of step 3, SAS Test Harness will not provide any positive response (responseCode=0) to further request messages from the UUT.	–	–
5	Monitor the RF output of each UUT from start of test until 60 seconds after Step 3 is complete. This is the end of the test. Verify: • UUT shall not transmit RF	☒	☐

For the test log please refer to Section 9 of this test report.

8.2 6.1.4.1.4 [WINNF.FT.D.REG.4] Domain Proxy Single-Step registration for Cat A CBSD

8.2.1 Definitions and limits

6.1 CBSD Registration Process

This section provides test steps, conditions and procedures to test the conformance of the CBSD implementation for the CBSD Registration Procedure. A precondition is the CBSD has successfully discovered the SAS it wants to register with.

This test is mandatory for DP connected to CBSDs which report all Required and REG-Conditional parameters in the Registration request to the SAS, without CPI signed data. This test validates that each of the required and REG-Conditional parameters appear within the registration request message. This test case applies to Domain Proxy supervising two CBSDs.

For a Category A CBSD which determine own location, the test lab and vendor must agree on the required evidence showing the UUT meets the location requirement. In lieu of location verification, the vendor shall supply their test approach/procedure along with compliance data.

8.2.2 Test date

8.3 6.1.4.1.6 [WINNF.FT.D.REG.6] Domain Proxy Single-Step registration for CBSD with CPI signed data

8.3.1 Definitions and limits

6.1 CBSD Registration Process

This section provides test steps, conditions and procedures to test the conformance of the CBSD implementation for the CBSD Registration Procedure. A precondition is the CBSD has successfully discovered the SAS it wants to register with.

This test is mandatory for DP with CBSDs which report all Required and REG-Conditional parameters in the Registration request to the SAS using CPI signed data. This test validates that each of the required and REG-Conditional parameters appear within the registration request message. This test case applies to Domain Proxy supervising two CBSDs.

All Category B devices, and Category A devices not able to determine its own location require installation by a CPI. This test is for devices where the CPI enters data into the CBSD and this information along with the CPI signature are sent in the request message. Excluded from this test are devices which require the CPI to enter the information into a SAS interface. These devices would follow the multiple step registration test [WINNF.FT.D.REG.2].

8.4 6.1.4.1.7 [WINNF.FT.C.REG.7] Registration due to change of an installation parameter

8.4.1 Definitions and limits

6.1 CBSD Registration Process

This section provides test steps, conditions and procedures to test the conformance of the CBSD implementation for the CBSD Registration Procedure. A precondition is the CBSD has successfully discovered the SAS it wants to register with.

The purpose of this test is to verify the CBSD sends notification to the SAS when an installation parameter has been changed.

This test is limited to CBSDs that support a registration parameter change/update to be made at the CBSD.

Further, this test only applies to CBSD devices that allow a registration parameter change to be made prior to sending a deregistration.

This test is not valid for CBSDs requiring a deregistration prior to allowing a parameter change to be made (for example, (i) bring CBSD out of service (deregister), (ii) change registration parameter, (iii) bring CBSD back into service (register)). Refer to the deregistration test case [WINNF.FT.C.DRG.1].

This test is also not valid for CBSDs which require registration parameter updates to be made directly into the SAS via a SAS interface.

8.5 6.1.4.2.2 [WINNF.FT.D.REG.9] Domain Proxy Missing Required parameters (responseCode 102)

8.5.1 Definitions and limits

6.1 CBSD Registration Process

CBSD under test cannot be expected to generate a message with a missing or invalid parameter. To test for responseCode not equal to 0, the SAS Test Harness will respond to a valid registrationRequest message with a registrationResponse with a non-zero responseCode.

The purpose of these tests is to ensure that the CBSD does not transmit when a responseCode other than 0 is received. The information sent in the registration request message is not important, only that it shall conform to the protocol.

Missing/Invalid response codes are tested by injecting those responseCodes into the SAS Test Harness generated response message, even though the UUT has sent a valid message

This test case applies to Domain Proxy supervising two CBSDs. The following are the test execution steps where the Registration response contains responseCode (Ri) = 102 for each CBSD

6.4 CBSD Heart Beat Process

This section provides procedures for testing CBSD behavior during the Heartbeat Process. It assumes as precondition that CBSD has successfully discovered the SAS that it wants to register with, has successfully registered, has a successful Grant request, and is in the Granted or Authorized state. The test cases in this section cover Heartbeat Response messages with non-zero responseCodes. Part of the pass/fail criteria of these test cases is the cessation of all UUT RF transmission. Therefore, in all test cases, after the non-zero responseCode is sent, the SAS Test Harness shall not allow any new Grant Request from the UUT to succeed.

6.4 CBSD Heart Beat Process

This section provides procedures for testing CBSD behavior during the Heartbeat Process. It assumes as precondition that CBSD has successfully discovered the SAS that it wants to register with, has successfully registered, has a successful Grant request, and is in the Granted or Authorized state. The test cases in this section cover Heartbeat Response messages with non-zero responseCodes. Part of the pass/fail criteria of these test cases is the cessation of all UUT RF transmission. Therefore, in all test cases, after the non-zero responseCode is sent, the SAS Test Harness shall not allow any new Grant Request from the UUT to succeed.

6.7 CBSD Deregistration Process

This section explains test steps/condition/procedure for the CBSD Deregistration Request and its subsequent actions following the reception of the Deregistration Responses from the SAS.

A Deregistration request is issued by a CBSD to request a SAS to deregister the CBSD from the SAS. A Deregistration Request Message issued by a CBSD is provided in [n.5], Section 10.11.

In the Deregistration Response message, the SAS should echo back an array of DeregistrationResponse object. Each deregistrationResponse object consists of a cbsdId and a responseCode. If the deregistration request was successful, the responseCode should be set to 0, otherwise responseCode is set to appropriate error value. The deregistrationResponse Message and the deregistrationResponse object are provided in [n.5], Section 10.12.

Each test generates a CBSD deregistration request and validates the CBSD takes the appropriate actions following the SAS deregistration response.

These deregistration test cases assume the CBSD is the source (operator initiated, for instance reset site). Deregistrations triggered by the SAS in a response message with a responseCode of 105 are covered in other test cases.

8.29.1 Definitions and limits

6.8 CBSD Security Validation

This section provides test steps, condition and procedures to test the conformance of the CBSD implementation for the Security Establishment Procedure. A precondition is the CBSD has successfully discovered the SAS it wants to communicate with.

In all test cases under this category, the TLS connection is established successfully between the SAS Test Harness and CBSD. A pre-condition for these tests is that Certificates at CBSD and SAS Test Harness are correct and valid. The security procedure is irrespective of the procedures defined for the SAS Test Harness to CBSD communication.

Place in the WinnForum SAS Test Harness the correct SAS Test Harness X.509 certificates for this test case. Edit the conf.xml file appropriately for use of this certificate.

Verify the SAS Test Harness X.509 certificate is the correct X.509 certificate for this test case by inspecting its content as described in the "readme_file_x509_RSA_certs_test_labs.txt" [WINNF-IN-0156 Version V1.0.0.1]. For test case [WINNF.FT.C.SCS.1] the X.509 certificate is the regular SAS Test Harness X.509 certificate used for the Interface Conformance Testing in [WINNF-TS-0122 Version V1.0.0].

The method for executing CBSD/DP UUT security test case is via Wireshark.

8.30 6.8.4.2.1 [WINNF.FT.C.SCS.2] TLS failure due to revoked certificate

8.30.1 Definitions and limits

This section provides test steps, condition and procedures to test the conformance of the CBSD implementation for the Security Establishment Procedure. A precondition is the CBSD has successfully discovered the SAS it wants to communicate with.

In all test cases under this category, the TLS connection is not established successfully between the SAS Test Harness and CBSD. The security procedure is irrespective of the procedures defined for the SAS Test Harness to CBSD communication.

Test case pre-requisite:

- The certificate at the SAS Test Harness shall be marked as revoked

8.30.2 Test date

Start date	October 3, 2018
------------	-----------------

8.30.3 Observations, settings and special notes

Place in the WinnForum SAS Test Harness the correct SAS Test Harness X.509 certificates for this test case. Edit the conf.xml file appropriately for use of this certificate.

Verify the SAS Test Harness X.509 certificate is the correct X.509 certificate for this test case by inspecting its content as described in the "readme_file_x509_RSA_certs_test_labs.txt" [WINNF-IN-0156 Version V1.0.0.1]. For test case [WINNF.FT.C.SCS.2] the X.509 certificate has

- Proper Validity time (the X.509 certificate is not expired)
- X.509v3 extension of "Authority Information Access: OCSP - URI: http://ocsp.testharness.cbrstestlab.com" (this URI is an example of the OCSP server available for the test lab)
- X.509v3 extension of "CRL Distribution Points: Full Name: URI: http://crlserver.testharness.cbrstestlab.com/crlserver.crl" (this URI is an example of the CRL server and CRL file available for the test lab)
- Certificate Serial Number appears as "Revoked" in the CRL file located in the CRL server available for the test lab, or appears as "Revoked" in the OCSP server available for the test lab.

For execution of this test case the CRL file must have proper validity. If this test is intended to be executed when the validity date of the CRL file has expired, a new CRL file with proper validity needs to be generated as described in the "readme_file_x509_RSA_certs_test_labs.txt" [WINNF-IN-0156 Version V1.0.0.1].

For execution of this test case, the test lab also requires an available DNS server to resolve FQDNs of the OCSP server or CRL server. The method for executing CBSD/DP UUT security test case is via Wireshark.

8.35 KDB 940660 D02 CPE handshake timing requirements

8.35.1 Definitions and limits

There are circumstances where an End-User Device operating as a CPE could be receiving a signal from a BTS-CBSD or another CBSD that is already authorized by the SAS, but the CPE needs to operate at signal levels higher than the 23 dBm permitted by rules for End-User Devices. In that case, the rules permit such devices to be authorized as a CBSD operating at higher power levels [Section 96.47(b)], and the CPE must register with a SAS as a CBSD. Other resources, if available, such as a wireline or wireless broadband service should be used to access the SAS. If there are no other means to close the loop with a SAS, the CPE may establish a connection with the SAS by using the frequencies authorized for the BTS-CBSD ("in band" communications), under the following conditions that will be implemented through the equipment authorization program

8.35.2 Test date

Start date	July 4, 2019

8.35.3 Observations, settings and special notes

Declaration of the manufacturer provided in the following document name: *Justification Letter_r7*

Following the FCC KDB 940660 D02 CPE-CBSD Handshake Procedures v01, when running the test cases in WINNF-TS-0122 Version 1.0.1 for CPE-CBSD device type, for the last execution step appearing in WINNF-TS-0122 Version 1.0.1:

- The PASS/FAIL criteria "UUT shall not transmit RF" is replaced by "CPE-CBSD UUT shall not transmit user traffic"
- The PASS/FAIL criteria "UUT shall stop transmission" is replaced by CPE-CBSD UUT shall stop transmitting user traffic"

8.35.4 Test data

The CBSD – CBSD Handshake and the approach to SAS server through the BTS-CBSD Procedures:

1. CBSD-Subscriber Station and CBSD-Base station are pre- defined on SAS gateway.
2. SAS gateway approach SAS server to get grant (frequency and power).
3. Only after both WQE5237001 and WQE723702 get grant, the SAS gateway enable CBSD-Base station (WQE723702) transmission.
4. CBSD-Base station will transmit per Frequency and power allowed by SAS server.
5. CBSD-Subscriber Station is in "listen" mode over the air (doesn't transmit at all) at this point. Now that CBSD-Base station allowed to transmit, CBSD-Subscriber will "hear" the CBSD-Base station and will associate with CBSD-Base station.
6. Important note: CBSD-Subscriber using the same frequency as CBSD-Base station was granted, both are a TDD system, Base station and Subscriber Station frequencies MUST be same.
7. Subscriber Station will connect to Base station for communicating and approach to the SAS only (registration and authorization) and with low power (minimum power to achieve association with base station), at this point our SAS gateway will immediately check of this CPE is approve and granted, it will enforce allowed power immediately. It will work with allowed frequency of BTS-CBSD because it TDD system (downlink and uplink frequencies are the same).
8. Registration and authorization will be done at a time limited in duration and duty cycle to the minimum time necessary to get a grant from the SAS; this time should not exceed 1 second within any 10-second period, 10 seconds within any 300-second period, or 20 seconds within any 3600-second period.
Tested according to : <https://www.wirelessinnovation.org/information-documents> , [CBRS CPE-CBSD as UUT Test Guidelines](#)
9. The maximum number of unsuccessful attempts to complete a registration of the CPE-CBSD is limited to 5 attempts.

Table 8.35-1: Test results

Step	Test Execution Steps	Pass	Fail
1	CPE-CBSD as UUT does not receive any RF signal from its "Compatible BTSCBSD", so CPE-CBSD as UUT does not transmit	☒	☐
2	Use the WinnForum SAS Harness #1 for CPE-CBSD as UUT and run test case WINNF.FT.C.GRA.1 for CPE-CBSD as UUT.	☒	☐
3	CPE-CBSD as UUT starts to receive the RF signal from its "Compatible BTSCBSD", so CPE-CBSD can start communicating with the WinnForum SAS Harness #1. Make note of the time when RF Test equipment logs the first transmission from CPECBSD which is above 23 dBm/10 MHz – this is the start time of the {X time out of Y time}.	☒	☐
4	When the test case WINNF.FT.C.GRA.1 finishes and the questions appear on the WinnForum SAS Harness #1 console, do NOT answer the questions. Wait until Y time has passed from step #3. During this Y time, the RF test equipment is logging the amount of time CPE-CBSD as UUT transmitted EIRP above 23 dBm/10 MHz. The amount of time logged for transmitting EIRP above 23 dBm/10 MHz is the X time.	☒	☐
5	Answer the questions on the WinnForum SAS Harness #1 console so the WinnForum SAS Harness #1 is ready for the next test	☒	☐
6	Time should not exceed 1 second within any 10-second period	☒	☐
6	Time should not exceed 10 seconds within any 300-second period	☒	☐
6	Time should not exceed 20 seconds within any 3600-second period	☒	☐

Running WINNF.FT.C.GRA.1 results that CPE-CBSD as UUT gets "stuck" in Grant Response with responseCode = 400 (INTERFERENCE) for the entire Y duration time (never reaching AUTHORIZED or even GRANTED state) which allows to measure the {X out of Y time} transmission of the CPE-CBSD as UUT.

Figure 5: {CPE-CBSD + Domain Proxy} as UUT, {BTS-CBSD + Domain Proxy}

SAS Harness #1 is for the CPE-CBSD UUT,
SAS Harness #2 is for the "compatible BTS-CBSD".
SAS Test Harness #1 is running the test cases described in WINNF-TS-0122 Version 1.0.1.
SAS Test Harness #2 is running test case WINNF.PT.C.HBT.1.

1. CPE-CBSD as UUT does not receive any RF signal from its "Compatible BTSCBSD", so CPE-CBSD as UUT does not transmit:

Figure 8.35-1: CPE-CBSD as UUT does not transmit

2. CPE-CBSD as UUT starts to receive the RF signal from its "Compatible BTSCBSD", so CPE-CBSD can start communicating with the WinnForum SAS Harness #1. Make note of the time when RF Test equipment logs the first transmission from CPE-CBSD which is above 23dBm/10MHz – this is the start time of the {X time out of Y time}.
3. When the test case WINNF.FT.C.GRA.1 finishes and the questions appear on the WinnForum SAS Harness #1 console, do NOT answer the questions. Wait until Y time has passed from step #3. During this Y time, the RF test equipment is logging the amount of time CPE-CBSD as UUT transmitted EIRP above 23dBm/10MHz. Testing the 940660 D02 CPE-CBSD Handshake Procedures v01

* CPE may establish a connection with the SAS by using the frequencies authorized for the BTS-CBSD ("in band" communications),

("in band" communications), the CPE and B.S are always on the same frequency.

Figure 8.35-5: Base station frequency = 3615 MHz

Figure 8.35-6: CPE frequency = 3615 MHz

* the CPE needs to operate at signal levels higher than the 23 dBm permitted by rules for End-User Devices. In that case, the rules permit such devices to be authorized as a CBSD operating at higher power levels

Validate that CPE-CBSDs is Registering with SAS when operating below 23 dBm.

Validate method, setting CPE-CBSD UUT to transmitted EIRP below 23 dBm/10 MHz , and verify that CPE-CBSDs register with the SAS.
