2 Equipment under Test (EUT)

Product type: 125kHz Read / Write System
Model Name: TS-RW38
Identical model: TS-R38*
Manufacturer: GiS mbH
Serial number: 1650-242V1.17 #0407
FCC ID: WR5TSRW38
Application freq. band: N/A
Frequency range: 125kHz
Operating frequency: 125kHz
Number of RF-channels: 1
Modulation: AM (write operation) AM/PM (read operation)
Antenna type: PCB antenna
☐ detachable ☒ not detachable

Power supply: 5V USB
Temperature range: -10°C to +55°C

*Note: The TS-R38 is electrical identical to TS-RW38. The only difference is a software lock for the write operation. Therefore the complete tests were made with TS-RW38 in both operation modes (read, write).

2.1 Photo documentation

For photos of the EUT, see annex B.
For photos taken during testing, see annex A.

2.2 Short description of the EUT

125kHz Read / Write system for RFID tags

2.3 Operation mode

The EUT was tested in the following operation modes:

- Continuous reading data from RF ID tag
- Continuous writing data on RF ID tag

2.4 Configuration

The following peripheral devices and interface cables were connected during the tests:

Device	Model:	S/N
125kHz Read / Write System	TS-RW38	1650-242V1.17 #0407
Notebook	Fujitsu Lifebook	N/A

Used cables

Numbers:	Description: (type / lengths / remarks)	Serial No
1	Data & power cable / 2,0/ shielded	N/A
1	AC cable, unshielded, 1.5m	N/A

Page 8 of 23

3.4 Test procedure

1. The tests of conducted emission were carried out in a shielded room using a line impedance stabilization network (LISN) 50 μ H/50 Ohms and an EMI test receiver.
2. The EMI test receiver was connected to the LISN and set to a measurement bandwidth of 9 kHz in the frequency range from 0.15 MHz to 30 MHz.
3. The EUT was placed on a wooden table and connected to the LISN.
4. To accelerate the measurement the detector of the EMI test receiver was set to peak and the whole frequency range from 0.15 MHz to 30 MHz were scanned.
5. After that all peaks values with fewer margins than 10 dB to quasi-peak limit or exceeding the limit were marked and re-measured with quasi-peak detector.
6. If after that all values are under the average limit no addition measurement is necessary. In case there are still values between quasi-peak and average limit than these values were re-measured again with an average detector.
7. These measurements were done on all current carrying conductors.

According to ANSI C63.4, section 13.1.3.1 testing of intentional radiators with detachable antennas shall be done with a dummy load otherwise the tests should be done with connected antenna and if adjustable fully extended.

3.5 Test setup

Picture 1: Outline of conducted emission test setup

Comments: All peripheral devices were additionally decoupled by means of a line stabilization network.

4.3 Limits

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

In case the emission fall within the restricted band specified on 15.205(a), then the 15.209(a) limit in the table below has to be followed.

Frequency [MHz]	Field strength Fs [μV/m]	Field strength [dBμV/m]	Measurement distance d [m]
0.009 – 0.490	266.6 – 4.9	48.5 – 13.8	300
0.490 – 1.705	48.98 – 14.08	33.8 – 22.97	30
1.705 – 30.0	30	29.54	30
30 – 88	100	40	3
88 – 216	150	43.5	3
216 - 960	200	46	3
Above 960	500	54	3

4.4 Test procedure

1. Configure the EUT according to ANSI C63.4. The EUT was placed on the top of the turntable 0.8 meter above ground. The receiving antenna was placed 3 meters from the turntable. The test setup was placed inside a compact diagnostic chamber.
2. Power on the EUT and all peripherals.
3. The broadband antenna was set to vertical polarization.
4. The EMI receiver performed a scan from 30MHz to 1000MHz with the detector set to peak and the measurement bandwidth to 120 kHz.
5. The turn table was rotated to 6 different positions (360° / 6) and the antenna polarization was changed to horizontal.
6. Repeat the test procedure at step 4 and 5.
7. The test setup was then placed in an OATS at 3 m distance and all peak values over or with less distance to limit then 6dB were marked and re-measured with a quasi-peak detector.
8. The turntable was rotated by 360 degrees to determine the position of the highest radiation.
9. The height of the broadband receiving antenna was varied between one meter and four meters above ground to find the maximum emissions field strength of both horizontal and vertical polarization. The highest value was recorded.
10. For emissions below 30MHz, measurement were done with a loop antenna. The recorded data were measured in QP mode off the receiver. Antenna height was not changed during this test.
