Summary

This test report supports an application for certification of a transmitter operating pursuant to: CFR Title 47 FCC Part 15.247, ISED Canada RSS-247 Issue 2

“MX2203/4” is a Bluetooth Low Energy transmitter operating in the 2402 MHz to 2480 MHz frequency range.

Antenna Type: Internal surface mount chip

Gain: 1.3dBi

We found that the product met the above requirements without modification.

Test samples were received in good condition.

Data tables may contain Curtis-Straus LLC.

Curtis-Straus LLC. a wholly owned subsidiary of Bureau Veritas was merged into its parent company in 2019.

Issue No.	Reason for change	Date Issued

Test Methodology

All testing was performed according to the following rules/procedures/documents;
CFR 47 FCC Part 15.247, RSS-247 Issue 2, RSS-Gen Issue 5, FCC KDB 558074 D01 DTS
Measurement Guidance v05r02 and ANSI C63.10-2013.

Radiated emissions were maximized by rotating the device around 3 orthogonal planes (X, Y and Z) as well as varying the test antenna's height and polarity. The device antenna could not be maximized separately.

RF measurements were performed at the antenna port. Three channels were tested as follows:

- Low Channel - 2402MHz
- Mid Channel - 2440MHz
- High Channel - 2480MHz

EUT operating voltage is 3VDC from battery.

The following bandwidths were used during radiated spurious emissions testing.

Frequency	RBW	VBW
0.15-30MHz	9kHz	30kHz
30-1000MHz	120kHz	1MHz
1-25GHz	1MHz	3MHz

Duty Cycle Correction Factor

Limits:

Unless otherwise specified, e.g., §§15.255(b), and 15.256(l)(5), when the radiated emission limits are expressed in terms of the average value of the emission, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds. As an alternative (provided the transmitter operates for longer than 0.1 seconds) or in cases where the pulse train exceeds 0.1 seconds, the measured field strength shall be determined from the average absolute voltage during a 0.1 second interval during which the field strength is at its maximum value. The exact method of calculating the average field strength shall be submitted with any application for certification or shall be retained in the measurement data file for equipment subject to notification or verification.

Spurious Emissions were investigated from 9KHz to 25 GHz on all 3 Channels (2402, 2440 and 2480 MHz) at the EUT antenna port. All emissions found were at noise floor levels; except the fundamental frequencies. Highest noise floor level was found around -60dB for the entire range, which is more than 10dB below the fundamental limit (see Plots attached right below for more details)
