Product information

Manufacturers declarations

	Transceiver
Operating frequency range	2402 - 2480 MHz
Type of modulation	GFSK; Pi/4 DQPSK; 8 DPSK / FHSS
Number of channels	79
Channel separation	1 MHz
Type of antenna	Integral antenna
Antenna gain (dBi)	0
Power level	fix
Type of equipment	stand alone radio device
Connection to public utility power line	No
Nominal voltage	V _{nor} : 3.3V
Independent Operation Modes	Page scan
	Inquiry scan
	Connection state - ACL Link
	Connection state - SCO Link

Product function and intended use

The test item is a Bluetooth Module based on the Bluetooth technology.

Bluetooth is a short-range radio link intended to be a cable replacement between portable and/or fixed electronic devices.

Bluetooth operates in the unlicensed ISM Band at 2.4GHz. With the introduction of the enhanced data rate (EDR) feature, the data rates can be up to 3 Mb/s.

An increase in the peak data rate beyond the basic rate of 1 Mb/s is achieved by modulating the RF carrier using phase shift keying (PSK) techniques, resulting in an increase of two to three times the number of bits per symbol. The 2 Mb/s EDR packets use a Pi/4-DQPSK modulation and the 3 Mb/s EDR packets use 8DPSK modulation.

Modification of product

Change as follow:

- Antenna is changed, with same type but different in antenna gain. Antenna gain is changed from -2 to 0.
- matching circuit to antenna is changed with 3 components.

To show compliance, the following tests were repeated on the modified sample:

Radiated spurious Emission
Peak Output Power
Radiated Emission in Restricted Bands next to Band-edge

Preliminary tests were performed in different data rate to find the worst radiated emission. The data rate shown in the table below is the worst-case rate with respect to the specific test item. Investigation has been done on all the possible configurations for searching the worst cases.

Remark

--

Test Report No.: 14026758 004 Date: 20.11.2014 page 5 of 15

Independent Operation Modes

The basic operation modes are:

- Radio communication link maintained with data transfer.

For further information refer to User Manual

Related Submittal(s) Grants

This is a single application for class II permissive change certification of the transmitter.

Test Report No.: 14026758 004 Date: 20.11.2014 page 6 of 15

Test Set-up and Operation Mode

Principle of Configuration Selection

Emission: The EUT was configured to measure its highest possible radiation level. The test modes

were adapted accordingly in reference to the instructions for use.

Test Operation and Test Software

Test operation should refer to test methodology.

- 1) The EUT was powered by the external power supply via the connecting adapter

 2) A control software CSR BlueTest 3 was used to control the transmitting frequency, modulation and output power of the EUT.

Special Accessories and Auxiliary Equipment

The product has been tested together with the following additional accessory:

 AC/DC Power adaptor Model number: PSM02R-055 Input: 100-240VAC, 50-60Hz, 0.1A

Output: 5.5VDC 0.35A

2. LPT cable provided by client

Countermeasures to achieve EMC Compliance

- none

Test Report No.: 14026758 004 Date: 20.11.2014 page 7 of 15

Test Methodology

Radiated Emission

The radiated emission measurements were performed according to the procedures in ANSI C63.4-2003.

The equipment under test (EUT) was placed at the middle of the 80 cm height turntable, and the turntable is 3 meters far from the measuring antenna. During the testing, the EUT was operated standalone and arranged for maximum emissions. The EUT was tested in three orthogonal planes.

The investigation is performed with the EUT rotated 360°, the antenna height scanned between 1m and 4m, and the antenna rotated to repeat the measurements for both the horizontal and vertical antenna polarizations. Repeat the measurement steps until the maximum emissions were obtained.

All radiated tests were performed at an antenna to EUT with 3 meters distance, unless stated otherwise in particular parts of this test report.

Field Strength Calculation

The field strength at 3 m was established by adding the meter reading of the spectrum analyzer to the factors associated with antenna correction factor, cable loss, preamplifiers and filter attenuation.

The equation is expressed as follow:

FS = R + AF + CF + FA - PA

Where FS = Field Strength in dBuV/m at 3 meters.

R = Reading of Spectrum Analyzer in dBuV.

AF = Antenna Factor in dB.

CF = Cable Attenuation Factor in dB.

FA = Filter Attenuation Factor in dB.

PA = Preamplifier Factor in dB.

FA and PA are only be used for the measuring frequency above 1 GHz.

Test Report No.: 14026758 004 Date: 20.11.2014 page 8 of 15

Subclause 15.247 (b)(1) - Peak Output Power

Pass

Test Specification: FCC Public Notice DA 00-705

Mode of operation: Tx mode (2402MHz, 2441MHz, 2480MHz), GFSP, π/4-DQPSK and 8DPSK

Port of testing : Temporary antenna port

Detector : Peak

RBW/VBW : 3 MHz / 10 MHz

Supply voltage : 3.3 VDC Temperature : 23°C Humidity : 50%

Requirement: For frequency hopping systems operating in the 2400-2483.5 MHz band employing at

least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 Watt. For all other frequency hopping systems in the 2400-

2483.5 MHz band: 0.125 Watts.

Results: For test protocols please refer to Appendix 1, page 2-7.

GFSK Modulation

Frequency (MHz)	Maximum peak output power (dBm)	Cable attenuation (dB)	Output power (dBm)	Limit (W/dBm)	Verdict
2402	-1.74	0.00	-1.74	1 / 30.0	Pass
2441	-2.41	0.00	-2.41	1 / 30.0	Pass
2480	-2.38	0.00	-2.38	1 / 30.0	Pass

$\pi/4$ -DQPSK Modulation

Frequency (MHz)	Maximum peak output power (dBm)	Cable attenuation (dB)	Output power (dBm)	Limit (W/dBm)	Verdict
2402	-2.14	0.00	-2.14	0.125 / 21.0	Pass
2441	-2.87	0.00	-2.87	0.125 / 21.0	Pass
2480	-2.87	0.00	-2.87	0.125 / 21.0	Pass

8DPSK Modulation

Frequency (MHz)	Maximum peak output power (dBm)	Cable attenuation (dB)	Output power (dBm)	Limit (W/dBm)	Verdict
2402	-1.98	0.00	-1.98	0.125 / 21.0	Pass
2441	-2.69	0.00	-2.69	0.125 / 21.0	Pass
2480	-2.66	0.00	-2.66	0.125 / 21.0	Pass

Subclause 15	.247 (d) – Band edge compliance of conducted emissions	Pass
Remark:	Please refer to test report 14026758 002 for test result.	

Test Report No.: 14026758 004 Date: 20.11.2014 page 12 of 15

Subclause 15.205 (a) - Restricted Bands next to Band-edge **Pass** Test Specification: FCC Public Notice DA 00-705 Mode of operation: Tx mode (2402MHz, 2480MHz), GFSK Port of testing : Enclosure Detector : a) Peak, b) Average RBW/VBW : a) 1 MHz / ≤ RBW (Peak), b) 1MHz / 10Hz (Average) Supply voltage : 3.3 VDC Temperature : 23ºC Humidity : 50% Requirement: Radiated emissions which fall in the restricted bans, as defined in 15.205 (a), must also comply with the radiated emission limits specified in 15.209(a). Results: Pre-scan has been conducted to determine the worst-case mode from all possible combinations between available modulations and packet types. There is no peak found in the restricted bands. For test protocols refer to Appendix 1, page 8-11.

Subclause 15.247 (d) – Spurious Conducted Emissions		Pass
Remark:	Please refer to test report 14026758 002 for test result.	

Test Report No.: 14026758 004 Date: 20.11.2014 page 13 of 15

Subclause 15.247 (c) - Spurious Radiated Emissions

Pass

Test Specification: ANSI C63.4 - 2003

Mode of operation: Tx mode (2402MHz, 2441MHz, 2480MHz), 8DPSK

Port of testing : Enclosure Detector : Peak / Average*

RBW/VBW : 100 kHz / 300 kHz for f < 1 GHz

1 MHz / 3 MHz for f > 1 GHz

Supply voltage : 3.3 VDC Temperature : 23°C Humidity : 50%

*Average reading using duty cycle correction factor on peak measurement:

Devices transmitting pulsed emissions and subject to a limit requiring an average detector function for radiated emissions shall initially be measured with an instrument that uses a peak detector. A radiated emission measured with a peak detector may then be corrected to a true average using the appropriate factor for emission duty cycle. This correction factor relates the measured peak level to the average limit and is derived by averaging absolute field strength over one complete pulse train that is 0.1 s, or less, in length.

Duty cycle correction factor 1 calculation for 2nd harmonics emission:

Total on time in one pulse = 2.912 ms Number of pulse found in 100ms = 1

Duty cycle factor = $20 \times \log (\text{ (on time x no. of pulse)} / 100 \text{ms})$

= -30.7 dB

Duty cycle correction factor 2 calculation for 1.6GHz spurious:

Total on time in 100ms = 0.3 ms

Number of pulse found in $100ms = 6 \times 5 = 30$

Duty cycle factor = $20 \times \log (\text{ (on time x no. of pulse)} / 100 \text{ms})$

= -20.9 dB

Requirement:

In any 100kHz bandwidth outside the frequency band at least 20dB below the highest level of the desired power. In addition, radiated emissions which fall in the restricted bands, as defined in section15.205(a), must also comply with the radiated emission limits specified in section 15.205(c).

Results:

Pre-scan has been conducted to determine the worst-case mode from all possible combinations between available modulations and packet types.

All three transmit frequency modes comply with the field strength within the restricted bands. There is no spurious found below 30MHz.
